Sur les train algèbres de degré quatre: structures et classifications. (French. English summary) [Fourth-degree train algebras: structures and classifications] *Comm. Algebra* **37** (2009), no. 2, 532–547.

Summary: “We study train algebras of fourth degree, give some genetic examples and specify the associated plenary train identities. These algebras fall ultimately into four classes; the first two of them do not have $1/2$ as train root and thus have idempotents. For these types we provide structure theorems, which are then used for classification purposes in small dimensions.”
