p. 6

$sl(2, F)$ is a simple Lie algebra

5/7/17

$$L = sl(2, F) \quad \text{basis} \quad x = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix} \quad y = \begin{pmatrix} 0 & 0 \\ 1 & 0 \end{pmatrix}$$

$$h = \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix}$$

$$[x, y] = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix} - \begin{pmatrix} 0 & 0 \\ 0 & 0 \end{pmatrix} = \begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix} - \begin{pmatrix} 0 & 0 \\ 0 & 1 \end{pmatrix} = \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix} = h$$

$$[h, x] = \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix} - \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix} = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix} - \begin{pmatrix} 0 & -1 \\ 0 & 0 \end{pmatrix} = \begin{pmatrix} 0 & 2 \\ 0 & 0 \end{pmatrix} = 2x$$

$$[h, y] = \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix} - \begin{pmatrix} 0 & 0 \\ 1 & 0 \end{pmatrix} = \begin{pmatrix} 0 & 0 \\ -1 & 0 \end{pmatrix} - \begin{pmatrix} 0 & 0 \\ 1 & 0 \end{pmatrix} = \begin{pmatrix} 0 & 0 \\ -2 & 0 \end{pmatrix} = -2y$$

let $I \neq 0$ be an ideal. of $\underbrace{ax+by+ch}_w \in I$

$$[x, w] = b[x, y] + c[x, h] = \underbrace{bh - 2cx}_w \in I$$

$$[x, u] = b[x, h] = \cancel{-2cx} = -2bx \in I$$

$$[y, w] = a[y, x] + c[y, h] = \underbrace{-ah + 2cy}_w \in I$$

$$[y, u] = -a[y, h] = -2ay \in I$$

$$\text{if } a \neq 0 \quad y \in I \quad ; \quad h = [xy] \in I \quad , \quad x = \frac{1}{2}[hx] \in I$$

$\therefore I = L$

$$\text{if } b \neq 0 \quad x \in I \quad , \quad h = [xy] \in I \quad , \quad y = -\frac{1}{2}[hy] \in I$$

$\therefore I = L$

$$\text{if } a=b=0 \quad , \quad 0 \neq ch \in I \Rightarrow a \in I \quad , \quad x = \frac{1}{2}[hx] \in I \quad , \quad y = -\frac{1}{2}[hy] \in I$$

$\therefore I = L$

P. 8

example 1 $L \subset gl(V)$ $g \in gl(V)$ invertible

$gL\bar{g}^{-1} = L \Rightarrow x \xrightarrow{\phi} g x \bar{g}^{-1}$ is an automorphism of L

$$\phi(x+y) = g(x+y)\bar{g}^{-1} = gx\bar{g}^{-1} + gy\bar{g}^{-1} = \phi(x) + \phi(y)$$

$$\begin{aligned}\phi([xy]) &= g(xy - yx)\bar{g}^{-1} = (gx\bar{g}^{-1})(gy\bar{g}^{-1}) - (gy\bar{g}^{-1})(gx\bar{g}^{-1}) \\ &= [\phi(x), \phi(y)].\end{aligned}$$

Proposition If δ is a nilpotent derivation of a Lie algebra L
then $\exp \delta := I + \delta + \frac{\delta^2}{2!} + \dots + \frac{\delta^{k-1}}{(k-1)!}$ ($\delta^k = 0$)
is an automorphism. In particular, if $\text{ad } x$ is
nilpotent, then $\exp(\text{ad } x)$ is an automorphism.

proof. First verify the Leibniz rule for derivation

$$\frac{\delta^n}{n!}(xy) = \sum_{i=0}^n \binom{1}{i!} \delta^i(x) \frac{1}{(n-i)!} \delta^{n-i}(y)$$

Note that, for
simplicity of
notation, we are
using xy for $[x,y]$.

$\boxed{n=1}$ is the definition of derivation
assume true for n .

$$\frac{\delta^{n+1}}{(n+1)!}(xy) = \frac{\delta}{n+1} \left(\frac{\delta^n}{n!}(xy) \right) = \frac{1}{n+1} \underbrace{\left(\sum_{i=0}^n \binom{1}{i!} \binom{1}{(n-i)!} (\underbrace{\delta^i(x) \delta^{n-i}(y)}_{\delta^i(x) \delta^{n-i}(y) + \delta^{i+1}(x) \delta^{n-i-1}(y)}) \right)}$$

$$\stackrel{?}{=} \sum_{i=0}^{n+1} \binom{1}{i!} \delta^i(x) \binom{1}{(n+1-i)!} \delta^{n+1-i}(y)$$

(3)

$$\begin{aligned}
& \text{work at } \frac{1}{n+1} \sum_{i=0}^n \left(\frac{1}{i!} \right) \left(\frac{1}{(n-i)!} \right) \left(\delta^i(x) \delta^{n-i+1}(y) + \delta^{i+1}(x) \delta^{n-i}(y) \right) \\
& = \frac{1}{n+1} \left(\sum_{i=0}^n \left(\frac{1}{i!} \right) \left(\frac{1}{(n-i)!} \right) \delta^i(x) \delta^{n-i+1}(y) + \sum_{i=0}^n \left(\frac{1}{i!} \right) \left(\frac{1}{(n-i)!} \right) \delta^{i+1}(x) \delta^{n-i}(y) \right) \\
& \quad \boxed{\sum_{j=1}^{n+1} \left(\frac{1}{(j-1)!} \right) \left(\frac{1}{(n-j+1)!} \right) \delta^j(x) \delta^{n-j+1}(y)} \\
& \quad \boxed{\sum_{i=1}^{n+1} \left(\frac{1}{(i-1)!} \right) \left(\frac{1}{(n-i+1)!} \right) \delta^i(x) \delta^{n-i+1}(y)} \\
& = \frac{1}{n+1} \left(\frac{1}{n!} \times \delta^{n+1}(y) + \sum_{i=1}^n \left(\frac{1}{i!} \right) \left(\frac{1}{(n-i)!} \right) \delta^i(x) \delta^{n-i+1}(y) + \frac{1}{(n-1)!} \frac{1}{(n+1)!} \delta^i(x) \delta^{n-i+1}(y) \right. \\
& \quad \left. + \frac{1}{n!} \delta^{n+1}(x) y \right) \\
& = \frac{1}{n+1} \left(\frac{1}{n!} \times \delta^{n+1}(y) + \sum_{i=1}^n \left(\left(\frac{1}{i!} \right) \left(\frac{1}{(n-i)!} \right) + \frac{1}{(i-1)!} \frac{1}{(n-i+1)!} \right) \delta^i(x) \delta^{n-i+1}(y) \right. \\
& \quad \left. + \frac{1}{n!} \delta^{n+1}(x) y \right)
\end{aligned}$$

It remains to prove

$$\begin{aligned}
& \frac{1}{n+1} \left(\left(\frac{1}{i!} \right) \left(\frac{1}{(n-i)!} \right) + \frac{1}{(i-1)!} \frac{1}{(n-i+1)!} \right) \stackrel{?}{=} \left(\frac{1}{i!} \right) \frac{1}{(n+1-i)!} \\
& \frac{1}{n+1} \left(\frac{n+1-i+i}{i! (n+1-i)!} \right) \quad \text{T WORKS.}
\end{aligned}$$

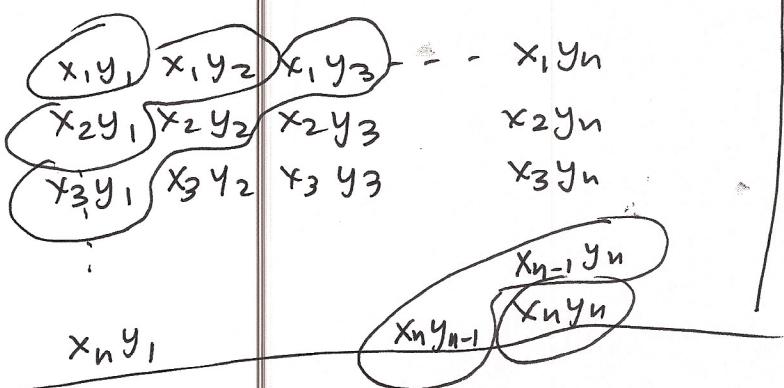

$\exp \delta$ is obviously a linear transf. Suppose $\delta^k = 0$.

$$\exp \delta_x \cdot \exp \delta(y) = \left(\sum_{i=0}^{k-1} \frac{\delta^i(x)}{i!} \right) \left(\sum_{j=0}^{k-1} \frac{\delta^j(y)}{j!} \right) = \sum_{n=0}^{2k-2} \left(\sum_{i=0}^n \frac{\delta^i}{i!} \frac{\delta^{n-i}}{(n-i)!} \right)$$

In different notation

$$\left(\sum_{i=1}^n x_i \right) \left(\sum_{j=1}^m y_j \right) = \sum_{i+j=k} x_i y_j = \sum_{k=2}^{2n} \sum_{i+j=k} x_i y_j$$

$$= \sum_{k=2}^{2n} \sum_{i=1}^k x_i y_{k-i}$$

Ceibniz

$$= \sum_{n=0}^{2k-2} \frac{\delta^n(xy)}{n!} = \sum_{n=0}^{k-1} \frac{\delta^n(xy)}{n!} + \sum_{n=k}^{2k-2} \circ = \exp \delta(xy)$$

so $\exp \delta$ is a homomorphism.

$$\text{let } \eta = \exp \delta - 1 = \delta + \frac{\delta^2}{2!} + \dots + \frac{\delta^{k-1}}{(k-1)!}$$

$$\text{Then } \eta^k = 0$$

$$\begin{aligned} \text{and } \exp \delta (1-\eta + \eta^2 - \eta^3 + \dots) &= (\pm 1) \eta^{k-2} + (\mp \eta) \eta^{k-1} \\ &= (1+\eta) (- - - - -) \end{aligned}$$

$$= 1 - \eta + \eta^2 - \eta^3 - \dots \pm \eta^{k-2}$$

$$+ \eta - \eta^2 + \eta^3 - \dots \pm \eta^{k-1} = \eta^{k-1} = \eta^k = \frac{1}{\eta^{k-1}}$$

$$\text{so } \exp \delta \text{ has inverse } (1 - \eta + \eta^2 - \dots \pm \eta^{k-2} = \eta^{k-1})$$

This proves
the proposition
on p. (2)

p. 9

def inner automorphism := $\exp(\text{inner derivation})$

$\text{Int } L = \text{all inner automorphisms is a } \underline{\text{normal}} \text{ subgroup}$

of $\text{Aut}(L)$: if $\phi \in \text{Aut}(L)$, $x \in L$

$$\phi(\text{ad } x)(y) = \phi([\text{ad } x, y]) = [\phi(x), \phi(y)]$$

$$(\text{ad } \phi(x))\phi(y) = [\phi(x), \phi(y)]$$

$$\text{so } \phi \cdot \text{ad } x \cdot \phi^{-1} = \text{ad } \phi(x)$$

example $L = sl(2, \mathbb{F})$ standard basis x, y, h

$$x = \begin{bmatrix} 0 & 1 \\ 0 & 0 \end{bmatrix} \quad y = \begin{bmatrix} 0 & 0 \\ 1 & 0 \end{bmatrix} \quad h = \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix}$$

let $\sigma = \exp(\text{ad } x) \cdot \exp(\text{ad } h - y) \cdot \exp(\text{ad } x) \in \text{Int } L$

($\text{Int } L$ is a group!)

$$(\text{ad } x)^3 = 0 \quad (\text{ad } y)^3 = 0$$

$$\exp \text{ad } x(x) = x$$

$$\begin{aligned} \exp \text{ad } h - y(x) &= (1 - \text{ad } y + \frac{(\text{ad } y)^2}{2})x = x - [y, x] + \frac{[y, [y, x]]}{2} \\ &= x - h - \frac{[y, h]}{2} = x - h - y \end{aligned}$$

$$\begin{aligned} \sigma(x) &= \left(1 + \text{ad } x + \frac{(\text{ad } x)^2}{2}\right)(x - h - y) = x - h - y - [x, h] - [x, y] \\ &\quad - \frac{1}{2}[x, [x, h]] - \frac{1}{2}[x, [x, y]] = x - h - y - 2x + h + x \\ &= -y \end{aligned}$$

$$\therefore \sigma(x) = -y. \quad (\text{similarly } \sigma(y) = -x \quad \sigma(h) = -h)$$

(6)

$$x^2 = \begin{vmatrix} 0 & 0 & 1 \\ 0 & 0 & 0 \end{vmatrix} = \begin{vmatrix} 0 & 0 \\ 0 & 0 \end{vmatrix}$$

$$\exp x = 1+x = \begin{vmatrix} 1 & 1 \\ 0 & 1 \end{vmatrix} \quad \left. \begin{array}{l} \text{determinants} \\ = 1 \end{array} \right\}$$

$$y^2 = \begin{vmatrix} 0 & 0 & 0 \\ 1 & 0 & 1 \end{vmatrix} = \begin{vmatrix} 0 & 0 \\ 0 & 0 \end{vmatrix}$$

$$\exp y = 1+y = \begin{vmatrix} 1 & 0 \\ 1 & 1 \end{vmatrix} = 1$$

$$s = \exp x \exp -y \exp x = \begin{vmatrix} 1 & 1 & 1 \\ 0 & 1 & -1 \\ 0 & 0 & 1 \end{vmatrix}$$

$$= \begin{vmatrix} 0 & 1 & 1 \\ -1 & 1 & 0 \end{vmatrix} = \begin{vmatrix} 0 & 1 \\ -1 & 0 \end{vmatrix} \quad \text{invertible. } s^{-1} = \begin{pmatrix} 0 & -1 \\ 1 & 0 \end{pmatrix}$$

$z \rightarrow szs^{-1}$ is an automorphism of L

By page 8 need to know $s \operatorname{sl}(2, F) s^{-1} = \operatorname{sl}(2, F)$

$$\begin{vmatrix} 0 & a & b \\ -1 & 0 & c-a \end{vmatrix} \begin{vmatrix} 0 & -1 \\ 1 & 0 \end{vmatrix} = \begin{pmatrix} c & -a \\ -a & -b \end{pmatrix} \begin{pmatrix} 0 & -1 \\ 1 & 0 \end{pmatrix} = \begin{pmatrix} -a & -c \\ -b & a \end{pmatrix} \quad \checkmark$$

$$sx s^{-1} \stackrel{?}{=} \sigma(x) = -y$$

$$sy s^{-1} \stackrel{?}{=} \sigma(y) = -x$$

$$sh s^{-1} \stackrel{?}{=} \sigma(h) = -h$$

$$sx s^{-1} = \begin{vmatrix} 0 & 0 & 1 & 0 & -1 \\ -1 & 0 & 0 & 0 & 1 \end{vmatrix} = \begin{vmatrix} 0 & 0 & 0 & -1 \\ 0 & -1 & 1 & 0 \end{vmatrix} = \begin{vmatrix} 0 & 0 \\ -1 & 0 \end{vmatrix} = -y \quad \checkmark$$

$$sy s^{-1} = \begin{vmatrix} 0 & 1 & 0 & 0 & -1 \\ -1 & 0 & 1 & 0 & 0 \end{vmatrix} = \begin{vmatrix} 1 & 0 & 0 & -1 \\ 0 & 0 & 1 & 0 \end{vmatrix} = \begin{vmatrix} 0 & -1 \\ 0 & 0 \end{vmatrix} = -x \quad \checkmark$$

$$sh s^{-1} = \begin{vmatrix} 0 & 1 & 1 & 0 & 0 & -1 \\ -1 & 0 & 0 & -1 & +1 & 0 \end{vmatrix} = \begin{vmatrix} 0 & -1 & 0 & -1 \\ -1 & 0 & 1 & 0 \end{vmatrix} = \begin{vmatrix} -1 & 0 \\ 0 & 1 \end{vmatrix} = -h \quad \checkmark$$

(7)

Proposition $L \subset gl(V)$ a linear Lie alg, $x \in L$ nilpotent

$$\Rightarrow (\exp x)y(\exp x)^{-1} = (\exp \text{ad } x)(y)$$

$$\exp x = 1 + x + \frac{x^2}{2!} + \dots + \frac{x^{k-1}}{(k-1)!} \quad x^k = 0$$

$$\exp \text{ad } x = I + \text{ad } x + \frac{(\text{ad } x)^2}{2!} + \dots$$

better to follow the proof in the book.

$$\text{ad } x(y) = xy - yx = \lambda_x y - \rho_x y$$

$$\lambda_x y = xy$$

$$\rho_x y = yx$$

so $\text{ad } x = \lambda_x + \rho_x$ and are nilpotent
if x is.

$$\exp \text{ad } x = \exp(\lambda_x + \rho_x) = \exp(\lambda_x) \exp \rho_x = \lambda_{\exp x} \exp(\rho_x)$$

first? if $TS = ST$

This proves the proposition!

$$\begin{aligned}
 & \cancel{\exp(T+S) = 1 + T+S + \frac{(T+S)^2}{2!} + \dots + \frac{(T+S)^{k-1}}{(k-1)!}} \\
 & \cancel{= 1 + T + S + \frac{T^2 + 2ST + S^2}{2!} + \dots} \\
 & (\exp T)(\exp S) = \left(1 + T + \frac{T^2}{2!} + \dots + \frac{T^{k-1}}{(k-1)!}\right) \left(1 + S + \frac{S^2}{2!} + \dots\right) \\
 & =
 \end{aligned}$$

(8)

$$\text{If } xy = yx$$

$$e^{x+y} = 1 + x+y + \frac{(x+y)^2}{2!} + \frac{(x+y)^3}{3!} + \dots$$

$$e^x e^y = (1+x+\frac{x^2}{2!}+\dots)(1+y+\frac{y^2}{2!}+\dots)$$

$$\begin{aligned}
&= \cancel{1+y+\frac{y^2}{2!}} + \cancel{\frac{y^3}{3!}} + \cancel{\frac{y^4}{4!}} + \cancel{\frac{y^5}{5!}} + \dots \\
&+ \cancel{x+x+y-\frac{xy^2}{2!}} + \cancel{\frac{xy^3}{3!}} + \cancel{\frac{xy^4}{4!}} + \cancel{\frac{xy^5}{5!}} + \dots \\
&+ \cancel{\frac{x^2}{2!}} + \cancel{\frac{x^2}{2!}y} + \cancel{\frac{x^2y^2}{2!2!}} + \cancel{\frac{x^2y^3}{2!3!}} + \cancel{\frac{x^2y^4}{2!4!}} + \cancel{\frac{x^2y^5}{2!5!}} + \dots \\
&+ \cancel{\frac{x^3}{3!}} + \cancel{\frac{x^3}{3!}y} + \cancel{\frac{x^3y^2}{3!2!}} + \cancel{\frac{x^3y^3}{3!3!}} + \cancel{\frac{x^3y^4}{3!4!}} + \dots
\end{aligned}$$

$$\begin{aligned}
e^{x+y} &= \cancel{1+x+y} + \cancel{\frac{x^2+2xy+y^2}{2!}} + \cancel{\frac{x^3+3xy^2+y^3}{3!}} + \dots \\
&\quad \cancel{\frac{x^4+(\frac{4}{4})x^3y+(\frac{4}{2})x^2y^2+(\frac{4}{3})xy^3}{4!}} + \cancel{\frac{3!}{4!}y^4} + \dots
\end{aligned}$$

this only works if $xy = yx$

This "proves" the first ? on P. (7)

$$\binom{4}{2} = \frac{4!}{2!2!} = \frac{24}{4} = 6$$

As for the second ? :

$$4! = 24$$

$$\exp \lambda_x = 1 + \lambda_x + \frac{(\lambda_x)^2}{2!} + \frac{(\lambda_x)^3}{3!} + \dots$$

$$= 1 + \lambda_x + \frac{\lambda_x^2}{2!} + \cancel{\frac{\lambda_x^3}{3!}} + \dots$$

$$= \cancel{\lambda} \exp x \quad \boxed{\times}$$
