A HOLOMORPHIC CHARACTERIZATION OF TERNARY RINGS OF OPERATORS

MATTHEW NEAL AND BERNARD RUSSO

Abstract. We prove that an operator space is completely isometric to a ternary ring of operators if and only if the open unit balls of all of its matrix spaces are bounded symmetric domains. A holomorphic characterization of C*-algebras is also given.

Introduction

In the category of operator spaces, that is, subspaces of $B(H)$ together with the induced matricial norm structure, objects are equivalent if they are completely isometric, i.e. if there is a linear isomorphism between the spaces which preserves this matricial norm structure. Since operator algebras are motivating examples for much of operator space theory, it is natural to ask if one can characterize which operator spaces are operator algebras. One satisfying answer was given by Blecher, Sinclair, and Ruan in [7], where it was shown that among operator spaces $A$ with a (unital but not necessarily associative) Banach algebra product, those which are completely isometric to operator algebras are precisely the ones whose multiplication is completely contractive with respect to the Haagerup norm on $A \otimes A$ (For a completely bounded version of this result, see [4]).

A natural object to characterize in this context are the so called ternary rings of operators (TRO’s). These are subspaces of $B(H)$ which are closed under the product $x y^* z$. This class includes C*-algebras. In fact, every TRO is (completely) isometric to a corner $p A (1-p)$ of a C*-algebra $A$. TRO’s are important because, as shown by Ruan [31], the injectives in the category of operator spaces are TRO’s (corners of injective C*-algebras) and not, in general, operator algebras (For the dual version of this result see [13]). The existence of injective envelopes of operator systems [30] and of operator spaces [31] have proven to be important tools, see for example [6]. Hamana (see [21]) proved that every operator space $A$ has a unique enveloping TRO $T(A)$ which is an invariant of complete isometry and has the property that for any TRO $B$ generated by a realization of $A$, there exists a homomorphism of $B$ onto $T(A)$. The space $T(A)$ is also called the Hilbert C*-envelope of $A$. It is shown in [5] that the Hilbert C*-envelope is the correct noncommutative generalization to operator spaces of the classical theory of Shilov boundary of function spaces. The characterization of TRO’s among operator spaces is the subject of this paper.

Closely related to TRO’s are the so called JC*-triples, norm closed subspaces of $B(H)$ which are closed under the product $(x y^* z + z y^* x)/2$. These generalize the

This work was supported in part by NSF grant DMS-0101153
class of TRO’s and have the property, as shown by Harris in [22], that isometries coincide with algebraic isomorphisms. It is not hard to see this implies that the algebraic isomorphisms in the class of TRO’s are complete isometries, since for each TRO A, \(M_n(A)\) is a JC*-triple (For the converse of this, see [21, Proposition 2.1]). It is also true that a commutative TRO \((xy^*z = zy^*x)\) is an associative JC*-triple and hence by [16, Theorem 2], is isometric (actually completely isometric) to a complex \(C_{\text{com}}\)-space, that is, the space of weak*-continuous functions on the set of extreme points of the unit ball of the dual of a Banach space which are homogeneous with respect to the natural action of the circle group, see [16]. Hence, if one views operator spaces as noncommutative Banach spaces, TRO’s are to operator spaces what \(C_{\text{com}}\)-spaces are to Banach spaces, while the more general objects, JC*-triples, lie somewhere in between. Injective operator spaces, which are the range of a completely contractive projection on some \(B(H)\), are completely isometrically TRO’s; the so called mixed injective operator spaces, those which are the range of a contractive projection on some \(B(H)\), are isometrically JC*-triples. The operator space classification of such objects was begun by the authors in [29] and is ongoing.

Relevant to this paper is another property shared by all JC*-triples (and hence all TRO’s). The open unit ball of every JC*-triple is a bounded symmetric domain. This is equivalent to saying that it has a transitive group of biholomorphic automorphisms. It was shown by Koecher in finite dimensions (see [28]) and Kaup [25] in the general case that this is a defining property for the slightly larger class of JB*-triples. The only illustrative basic examples of JB*-triples which are not JC*-triples are the space \(H_3(O)\) of 3 x 3 hermitian matrices over the octonians and a certain subtriple of \(H_3(O)\). These are called exceptional triples, and they cannot be represented as a JC*-triple. This holomorphic characterization has been useful as it gives an elegant proof, due to Kaup [26], that the range of a contractive projection on a JB*-triple is isometric to another JB*-triple. The same statement holds for JC*-triples, as proven earlier by Friedman and Russo in [18]. Youngson proved in [34] that the range of a completely contractive projection on a C*-algebra is completely isometric to a TRO. These results, as well as those of [1] and [12], are rooted in the fundamental result of Choi-Effros [9] for completely positive projections on C*-algebras and the classical result ([27],[15, Theorem 5]) that the range of a contractive projection on \(C(\Omega)\) is isometric to a \(C_n\)-space, hence a \(C_{\text{com}}\)-space.

Motivated by this characterization for JB*-triples, we will give a holomorphic characterization of TRO’s up to complete isometry. We will prove in Theorem 4.2 that an operator space \(A\) is completely isometric to a TRO if and only if the open unit balls \(M_n(A)_\circ\) are bounded symmetric domains for all \(n \geq 2\). As a consequence, we obtain in Corollary 4.5 a holomorphic operator space characterization of C*-algebras as well. It should be mentioned that Upmeier in [33] gave a different but still holomorphic characterization of C*-algebras up to isometry. We note in passing that injective operator spaces satisfy the above hypothesis, so we obtain that they are (completely isometrically) TRO’s based on deep results about JB*-triples rather than the deep result of Choi-Effros (See Corollaries 4.4 and 4.6).

We now describe the organization of this paper. Section 1 contains the necessary background and some preliminary results on contractive projections. In section 2, three auxiliary ternary products are introduced and are shown to yield the original JB*-triple product upon symmetrization. Section 3 is devoted to proving that these
three ternary products all coincide. Section 4 contains the statement and proof of the main result and its consequences.

Both authors wish to thank Professors Zhong-Jin Ruan and David Blecher for their advice and encouragement at the beginning stages of this work.

1. Preliminaries

An operator space will be defined as a vector space $A$ together with a linearly isometric representation as a subspace of some $B(H)$. This gives $A$ a family of operator norms $\| \cdot \|_n$ on $M_n(A) \subset B(H^n)$. As proved in [30], an operator space can also be defined abstractly as a vector space $A$ having a family of norms on $M_n(A)$ satisfying certain properties. These properties give rise to an isometric representation of the operator space as a subspace of $B(H)$ where the natural amplification maps preserve the matricial norm structure. This is analogous to (and generalizes) the way an abstract Banach space $B$ can be isometrically embedded as a subspace of $C(\Omega)$. The resulting operator space structure in this case is called MIN $(B)$ and is seen as a commutative quantization of $B$.

Two operator spaces $A$ and $B$ are $n$-isometric if there exists an isometry $\phi$ from $A$ to $B$ such that the amplification mapping $\phi_n : M_n(A) \to M_n(B)$ defined by $\phi_n(\alpha_{ij}) = (\phi(\alpha_{ij}))$ is an isometry. $A$ and $B$ are completely isometric if there exists a mapping $\phi$ from $A$ to $B$ which is an $n$-isometry for all $n$. For other basic results about operator spaces, see [14].

The following definition is a Hilbert space-free generalization of the TRO’s mentioned in the introduction.

**Definition 1.1** (Zettl [35]). A C*-ternary ring is a Banach space $A$ with ternary product $\{x, y, z\} : A \times A \times A \to A$ which is linear in the outer variables, conjugate linear in the middle variable, is associative:

$$[abc|cde] = [a|def|e] = [ab|e|c],$$

and satisfies $\|xyz\| \leq \|x\|\|y\|\|z\|$ and $\|xyz\| = \|x\|^3$.

The following is a Gelfand-Naimark representation theorem for C*-ternary rings.

**Theorem** (Zettl [35]) For any C*-ternary ring $A$, $A = A_1 \oplus A_1$, where $A_1$ is isometrically isomorphic to a TRO $B_1$ and $A_1$ is isometrically anti-isomorphic to a TRO $B_1$. (An anti-isomorphism in this context satisfies $\phi([xyz] = -\phi(x)\phi(y)^*\phi(z)).$

It follows that if $A_1 = 0$, then $A$ is ternary isomorphic to a TRO. In Theorem 4.2, we shall show that under suitable assumptions on an operator space $A$, it becomes a C*-ternary ring with $A_1 = 0$ and the above ternary isomorphism is a complete isometry from $A$ with its original operator space structure to a TRO.

The following definition generalizes the JC*-triples defined in the introduction.

**Definition 1.2** ([25]). A JB*-triple is a Banach space $A$ with a product $D(x, y)z = \{x, y, z\}$ which is linear in the outer variables, conjugate linear in the middle variable, is commutative: $\{x, y, z\} = \{z, y, x\}$, satisfies an associativity condition:

$$[D(x, y), D(a, b)] = D(\{x, y, a\}, b) - D(a, \{b, x, y\})$$

and has the topological properties that (1) $\|D(x, x)\| = \|x\|^2$ (2) $D(x, x)$ is hermitian (in the sense that $\|e^{itD(x, x)}\| = 1$) and has positive spectrum in the Banach algebra $B(A)$. We abbreviate $D(x, x)$ to $D(x)$. 
As noted in the introduction, JC*-triples, (and hence TRO’s and C*-algebras) are examples of JB*-triples. Other examples include any Hilbert space, and the spaces of symmetric and anti-symmetric elements of $B(H)$ under a transpose map defined by a conjugation.

If one ignores the norm and the topological properties in Definition 1.2, the algebraic structure which results, called a Jordan triple system, or Jordan pair, has a life of its own, [28]. Note that (1) can be written as

$$(2) \quad \{x, y, \{abz\}\} - \{a, b, \{xyz\}\} = \{\{xya\}, b, z\} - \{a, \{yxb\}, z\}.$$ 

For easy reference we record here two identities for Jordan triple systems which can be derived from (1) ([28, JPS,JP16]).

$$(3) \quad 2D(x, \{yxy\}) = D(\{xyx\}, z) + D(\{yzy\}, y)$$

$$(4) \quad \{\{xya\}, b, z\} - \{a, \{yxb\}, z\} = \{x, \{lay\}, z\} - \{\{abx\}, y, z\}$$

We will now list some facts about JB*-triples that are relevant to our paper. A survey of the basic theory can be found in [32]. As proved by Kupf [25], JB*-triples are in 1-1 isometric correspondence with Banach spaces whose open unit ball is a bounded symmetric domain. The triple product here arises from the Lie algebra of the group of biholomorphic automorphisms. This Lie algebra is the space of complete vector fields on the open unit ball which are certain polynomials of degree at most 2. Linearizing the quadratic terms gives the triple product.

It is this correspondence which motivates the study of the more general JB*-triples. Indeed, the proofs of two important facts follow naturally from the holomorphic point of view [26]. Firstly, the isometries between JB*-triples are precisely the algebraic isomorphisms. From this follows the important fact, used several times in this paper, that, unlike the case for binary products, the triple product of a JB*-triple is unique. Secondly, the range of a contractive projection $P$ on a JB*-triple $Z$ is isometric to a JB*-triple. More precisely, $P(Z)$ is a JB*-triple under the norm and linear operations of $Z$ and the triple product $\{xyz\}_P = P(\{xyz\})z$, for $x, y, z \in P(Z)$.

In the context of JC*-triples, these facts were proven by functional analytic methods in [22] and [18] respectively. These facts show that JB*-triples are a natural category in which to study isometries and contractive projections. Recently, in [10] the authors with C-H. Chu have shown that $w*$-continuous contractive projections on dual JB*-triples (called JBW*-triples) preserve the Jordan triple generalization of the Murray-von-Neumann type decomposition established in [23] and [24]. Two other properties of contractive projections were used in that work and will be needed in the present paper. They consist of two conditional expectation formulas for contractive projections on JC*-triples ([17, Corollary 1])

$$(5) \quad P\{Px, Py, Pz\} = P\{Px, Py, z\} = P\{x, y, Pz\};$$

and the fact that the range of a bicontractive projection on a JC*-triple is a subtriple [17, Proposition 1].

Let $A$ be a JB*-triple. For any $a \in A$, we have a triple functional calculus, that is, a triple isomorphism of the closed subtriple $C(a)$ generated by $a$ onto the commutative C*-algebra $C_0(\text{Sp}(D(a)) \cup \{0\})$ of continuous functions vanishing at
zero. Any JBW*-triple (defined above) has the property that it is the norm closure of the linear span of its tripotents, that is, elements $e$ with $e = \{ e e e \}$. A unitary tripotent is a tripotent $v$ such that $D(v, v) = 1 d$. For a C*-algebra, tripotents are the partial isometries and unitary tripotents are precisely the unitaries. For tripotents $u$ and $v$, algebraic orthogonality, i.e., $D(u, v) = 0$, coincides with Banach space orthogonality: $\| u \pm v \| = 1$. For $a$ and $b$ in $A$, we will denote the property $D(a, b) = 0$ by $a \perp b$.

As proved in [11], the second dual $A^{**}$ of a JBW*-triple $A$ is a JBW*-triple containing $A$ as a subtriple. Multiplication in a JBW*-triple is norm continuous and separately w*-continuous as proved in [2].

We close this section of preliminaries with an elementary proposition showing that certain concrete projections are contractive.

**Proposition 1.3.** Let $A$ be an operator space in $B(H)$.

(a): Define a projection $P$ on $M_2(A)$ by

$$P\left( \begin{bmatrix} a & b \\ c & d \end{bmatrix} \right) = \frac{1}{2} \begin{bmatrix} a + b & a + b \\ 0 & 0 \end{bmatrix}.$$ 

Then $\|P\| \leq 1$. Moreover, the restriction of $P$ to $\left\{ \begin{bmatrix} a & b \\ 0 & 0 \end{bmatrix} : a, b \in A \right\}$ is bicontractive.

(b): Let $P_{11} : M_2(A) \to M_2(A)$ be the map $\begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix} \mapsto \begin{bmatrix} a_{11} & 0 \\ 0 & 0 \end{bmatrix}$, and similarly for $P_{12}, P_{21}, P_{22}$. Then $P_{ij}$ is contractive and $P_{11} + P_{21}, P_{11} + P_{12},$ and $P_{11} + P_{22}$ are bicontractive.

(c): The projections $P : M_2(A) \to M_2(A)$ and $Q : P(M_2(A)) \to P(M_2(A))$ defined by

$$P\left( \begin{bmatrix} a & b \\ c & d \end{bmatrix} \right) = \frac{1}{2} \begin{bmatrix} a + d & b + c \\ b + c & a + d \end{bmatrix}$$

and

$$Q\left( \begin{bmatrix} a & b \\ c & d \end{bmatrix} \right) = \frac{1}{2} \begin{bmatrix} a + b & a + b \\ a + b & a + b \end{bmatrix}$$

are bicontractive.

**Proof.** We omit the proofs of (a) and (b). To prove (c), since for example $I - P = (I - (2P - I))/2$ and $P = (I + (2P - I))/2$, it suffices to show that $2P - I$ and $2Q - I$ are contractive. But

$$(2P - I)\left( \begin{bmatrix} a & b \\ c & d \end{bmatrix} \right) = \begin{bmatrix} d & c \\ a & b \end{bmatrix} = \begin{bmatrix} 1 & 1 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} a & b \\ c & d \end{bmatrix} = \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix} \begin{bmatrix} a & b \\ 0 & 0 \end{bmatrix},$$

and

$$(2Q - I)\left( \begin{bmatrix} a & b \\ c & d \end{bmatrix} \right) = \begin{bmatrix} b & a \\ a & b \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 1 & 0 \end{bmatrix} \begin{bmatrix} a & b \\ a & b \end{bmatrix}. \quad \Box$$

2. Additivity of the ternary products

Throughout this section, $A \subset B(H)$ will be an operator space such that the open unit ball $M_2(A)_0$ is a bounded symmetric domain. Let $\{ \cdot \cdot \cdot \}_M(A)$ denote the associated JBW*-triple product on $M_2(A)$. Note that although $M_2(A)$ inherits the norm and linear structure of $M_2(B(H)) = B(H \otimes H)$, its triple product $\{ \cdot \cdot \cdot \}_M(A)$ in general differs from the concrete triple product $(XY + ZY + XZ)/2$ of $B(H \otimes H)$. 

In fact, the results of this section would become trivial if these two triple products were the same.

By properties of contractive projections and the uniqueness of the triple product, \( A \), being linearly isometric to \( P_{1j}(M_{2}(A)) \) becomes a JB*-triple whose triple product \( \{xyz\}_A \) is given, for example, by

\[
\begin{bmatrix}
\{xyz\}_A & 0 \\
0 & 0
\end{bmatrix}
= P_{11}\left(\begin{bmatrix}
x & 0 & 0 \\
y & 0 & 0 \\
z & 0 & 0
\end{bmatrix}_M(A)\right),
\]

and similarly using the other \( P_{ij} \). Usually we shall just use the notation \( \{\cdots\} \) for either of the triple products \( \{xyz\}_A \) and \( \{\cdot\cdot\cdot\}_M(A) \).

We assume \( A \) is as above and proceed to define three auxiliary ternary products, denoted \( [\cdot,\cdot,\cdot] \), \( \langle\cdot,\cdot,\cdot\rangle \), and \( \langle\cdot,\cdot,\cdot\rangle \) and show their relation to \( \{\cdot,\cdot\cdot\} \). We begin with a sequence of lemmas which establish some properties of the terms in the following identity, where \( a, b, c \in A \).

\[
(6) \quad \begin{bmatrix}
a & a & 0 \\
0 & b & 0 \\
0 & 0 & c
\end{bmatrix}
= \begin{bmatrix}
a & 0 & 0 \\
0 & b & 0 \\
0 & 0 & c
\end{bmatrix}
+ \begin{bmatrix}
a & 0 & 0 \\
0 & 0 & 0 \\
0 & 0 & 0
\end{bmatrix}
+ \begin{bmatrix}
a & 0 & 0 \\
0 & 0 & 0 \\
0 & 0 & 0
\end{bmatrix}
+ \begin{bmatrix}
0 & a & 0 \\
0 & 0 & 0 \\
0 & 0 & 0
\end{bmatrix}
\]

It will be shown in Lemma 2.2 that the left side of (6) has the form

\[
\begin{bmatrix}
x & y \\
z & w
\end{bmatrix},
\]

where \((x + y)/2 = \{abc\}\). In Lemmas 2.4-2.6, each term on the right side of (6) will be analyzed.

**Remark 2.1.** The space

\[\tilde{A} = \{\tilde{a} = \begin{bmatrix} a & a \\
0 & 0
\end{bmatrix} : a \in A\}\]

with the triple product

\[
(7) \quad \{\tilde{a}\tilde{b}\tilde{c}\}_{\tilde{A}} := \begin{bmatrix}
2\{abc\} & 2\{abc\} \\
0 & 0
\end{bmatrix}
\]

and the norm of \( M_{2}(A) \) is a JB*-triple. (Note that by Proposition 1.3(a), \( \tilde{A} \) is a subtriple of \( M_{2}(A) \), but we do not know a priori that its triple product is given by (7))

**Proof.** The proposed triple product, which we denote by \( \{\tilde{a}\tilde{b}\tilde{c}\} \), is obviously linear and symmetric in \( \tilde{a} \) and \( \tilde{c} \), and conjugate linear in \( \tilde{b} \). Since, for example,

\[
\{\tilde{a}\tilde{b}\tilde{c}\tilde{d}\} = \begin{bmatrix}
2\{ab\{cde\}\} & 2\{ab\{cde\}\} \\
0 & 0
\end{bmatrix},
\]

the main identity (2) is satisfied.
From \( \left\| \begin{bmatrix} a & a \\ 0 & 0 \end{bmatrix} \right\| = \sqrt{2} \| a \| \) one obtains \( \left\| \{ \hat{a} \hat{a} \hat{a} \} \right\| = \| \hat{a} \|^3, \left\| \{ \hat{a} \hat{b} \hat{c} \} \right\| \leq \| \hat{a} \| \| \hat{b} \| \| \hat{c} \| \) and hence \( \left\| D(\hat{a}) \right\| = \| \hat{a} \|^2 \).

Since \( e^{itD(x)} y = (e^{2itD(x)} y^*)^\ast \),
\[
\| e^{itD(x)} y \| = \sqrt{2} \| e^{2itD(x)} y \| = \sqrt{2} \| y \| = \| y \|,
\]
so \( D(\hat{x}) \) is hermitian.

Finally, for \( \lambda < 0 \), the inverse of \( \lambda - D(\hat{x}) \) is given by
\[
\hat{y} \mapsto \begin{bmatrix} (\lambda - 2D(x))^{-1} y \\ 0 \end{bmatrix}.
\]

Hence, \( S_{P_B(\hat{\lambda})}(D(\hat{x})) \subset [0, \infty) \).

**Lemma 2.2.** For \( a, b, c \in A \), there exist \( x, y, z, w \in A \) such that
\[
\{ \begin{bmatrix} a & a \\ 0 & 0 \end{bmatrix} \begin{bmatrix} 0 & b \\ 0 & 0 \end{bmatrix} \begin{bmatrix} c & c \\ 0 & 0 \end{bmatrix} \} = \begin{bmatrix} x & y \\ z & w \end{bmatrix},
\]
and \( (x + y)/2 = \{ abc \} \).

**Proof.** Consider the projection \( P \) defined in Proposition 1.3(a). By (5),
\[
P(\{ \begin{bmatrix} a & a \\ 0 & 0 \end{bmatrix} \begin{bmatrix} 0 & b \\ 0 & 0 \end{bmatrix} \begin{bmatrix} c & c \\ 0 & 0 \end{bmatrix} \}) = P(\{ \begin{bmatrix} a & a \\ 0 & 0 \end{bmatrix} \begin{bmatrix} b/2 & 0 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} b/2 & 0 \\ 0 & 0 \end{bmatrix} \}).
\]

By Remark 2.1 and the uniqueness of the triple product in a \( JB^* \)-triple,
\[
P(\{ \begin{bmatrix} a & a \\ 0 & 0 \end{bmatrix} \begin{bmatrix} b & b \\ 0 & 0 \end{bmatrix} \begin{bmatrix} c & c \\ 0 & 0 \end{bmatrix} \}) = 2 \begin{bmatrix} \{ abc \} \\ 0 \end{bmatrix} \).
\]

Thus, if
\[
\{ \begin{bmatrix} a & a \\ 0 & 0 \end{bmatrix} \begin{bmatrix} 0 & b \\ 0 & 0 \end{bmatrix} \begin{bmatrix} c & c \\ 0 & 0 \end{bmatrix} \} = \begin{bmatrix} x & y \\ z & w \end{bmatrix},
\]
then
\[
\begin{bmatrix} \{ abc \} \\ \{ abc \} \end{bmatrix} = \begin{bmatrix} (x + y)/2 \\ (x + y)/2 \end{bmatrix}.
\]

It will be shown below in the proof of Lemma 2.8 that \( x = y = \{ abc \} \) and that each \( z = w = 0 \).

**Lemma 2.3.** For each \( a, b \in A \),
\[
\begin{bmatrix} a & 0 \\ 0 & b \end{bmatrix} \perp \begin{bmatrix} 0 & 0 \\ 0 & b \end{bmatrix} \text{ and } \begin{bmatrix} 0 & 0 \\ a & 0 \end{bmatrix} \perp \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix}
\]

**Proof.** Suppose first that \( a = \sum \lambda_i u_i \) where \( \lambda_i > 0 \) and the \( u_i \) are tripotents in \( A \), and similarly for \( b = \sum \mu_j v_j \). Because the image of a bicontractive projection is a subtriple ([17, Proposition 1]), \( U_i := \begin{bmatrix} u_i & 0 \\ 0 & 0 \end{bmatrix} \) and \( V_j := \begin{bmatrix} 0 & 0 \\ 0 & v_j \end{bmatrix} \) are tripotents, and since they are orthogonal in \( B(\hat{H} \oplus H) \), \( \| U_i \pm V_j \| = 1 \). Hence \( D(U_i, V_j) = 0 \) in (the abstract triple product of) \( M_2(A) \) and so for all \( x, y, z, w \in A \),
\[
\{ \begin{bmatrix} a & 0 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} 0 & 0 \\ 0 & b \end{bmatrix} \begin{bmatrix} x & y \\ z & w \end{bmatrix} \} = \sum_{i,j} \lambda_i \mu_j \{ \begin{bmatrix} u_i & 0 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} 0 & 0 \\ 0 & v_j \end{bmatrix} \begin{bmatrix} x & y \\ z & w \end{bmatrix} \} = 0.
\]

For the general case, note that, by [14, 3.2.1], there is an operator space structure on the dual of any operator space such that the canonical inclusion of \( A \) into \( A^{**} \) is a complete isometry. Moreover, by [3, Theorem 2.5] the norm structure on
$M_n(A^{**})$ coincides with that obtained from the identification $M_n(A^{**}) = M_n(A)^{**}$. Hence, for all $n$, $M_n(A^{**})$ is a JBW*-triple containing $M_n(A)$ as subtriple. Since each element of $A$ can be approximated in norm by finite linear combinations of tripotents in $A^{**}$, the first statement in the lemma follows from the norm continuity of the triple product.

Since interchanging rows is an isometry, hence an isomorphism, the second statement follows. \qed

**Lemma 2.4.** Let $a, b, c \in A$. Then

\[(9) \quad \{ \begin{bmatrix} a & 0 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} 0 & b \\ 0 & 0 \end{bmatrix} \begin{bmatrix} c & 0 \\ 0 & 0 \end{bmatrix} \} = 0,\]

\[(10) \quad \{ \begin{bmatrix} a & 0 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} 0 & 0 \\ b & 0 \end{bmatrix} \begin{bmatrix} c & 0 \\ 0 & 0 \end{bmatrix} \} = 0,\]

\[(11) \quad \{ \begin{bmatrix} a & 0 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} 0 & 0 \\ 0 & b \end{bmatrix} \begin{bmatrix} c & 0 \\ 0 & 0 \end{bmatrix} \} = 0.\]

**Proof.** The third assertion follows from Lemma 2.3. To prove the first statement, let $X$ denote $\{ \begin{bmatrix} a & 0 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} 0 & b \\ 0 & 0 \end{bmatrix} \begin{bmatrix} c & 0 \\ 0 & 0 \end{bmatrix} \}$. By (5),

$$P_{11}(X) = P_{11}(\{ \begin{bmatrix} a & 0 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} c & 0 \\ 0 & 0 \end{bmatrix} \}) = 0.$$ 

Similarly, $(P_{11} + P_{21})(X) = (P_{21} + P_{22})(X) = 0$, so that $X = \begin{bmatrix} 0 & x \\ 0 & 0 \end{bmatrix}$.

Let $X' = \begin{bmatrix} 0 & 0 \\ x & 0 \end{bmatrix}$. We claim that for any $Y \in M_2(A)$, $\{XX'Y\} = 0$. Indeed, with $A = \begin{bmatrix} a & 0 \\ 0 & 0 \end{bmatrix}$, $B = \begin{bmatrix} 0 & b \\ 0 & 0 \end{bmatrix}$, $C = \begin{bmatrix} c & 0 \\ 0 & 0 \end{bmatrix}$, we have $A \perp X'$, $C \perp X'$ and by (4), $\{XX'Y\} = \{ABC\}Y = \{|BAX'Y\} + \{|A|X'CBY\} - \{|CX'A\}BY\} = 0$. Thus $D(X, X') = 0$, which, by [19, Lemma 1.3(a)], implies that $X$ and $X'$ are orthogonal in the Banach space sense: $\|X \pm X'\| = \max(\|X\|, \|X'\|)$. Since $\|X + X'\| = \| \begin{bmatrix} 0 & x \\ 0 & x \end{bmatrix} \| = \sqrt{2}\|x\|$, it follows that $x = 0$. The second assertion is proved similarly, using $X = \begin{bmatrix} 0 & 0 \\ x & 0 \end{bmatrix}$, $X' = \begin{bmatrix} 0 & 0 \\ 0 & x \end{bmatrix}$. \qed

By interchanging rows and columns, it follows that the following triple products all vanish (the last three by orthogonality):

\[(12) \quad \{ \begin{bmatrix} 0 & 0 \\ 0 & a \end{bmatrix} \begin{bmatrix} 0 & 0 \\ b & 0 \end{bmatrix} \begin{bmatrix} 0 & 0 \\ c & 0 \end{bmatrix} \}, \quad \{ \begin{bmatrix} 0 & a \\ 0 & 0 \end{bmatrix} \begin{bmatrix} b & 0 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} 0 & c \\ 0 & 0 \end{bmatrix} \},\]

\[(13) \quad \{ \begin{bmatrix} 0 & 0 \\ a & 0 \end{bmatrix} \begin{bmatrix} 0 & 0 \\ 0 & b \end{bmatrix} \begin{bmatrix} 0 & 0 \\ c & 0 \end{bmatrix} \}, \quad \{ \begin{bmatrix} 0 & 0 \\ 0 & a \end{bmatrix} \begin{bmatrix} 0 & b \\ 0 & 0 \end{bmatrix} \begin{bmatrix} 0 & 0 \\ 0 & c \end{bmatrix} \},\]

\[(14) \quad \{ \begin{bmatrix} 0 & a \\ 0 & 0 \end{bmatrix} \begin{bmatrix} 0 & 0 \\ b & 0 \end{bmatrix} \begin{bmatrix} c & 0 \\ 0 & 0 \end{bmatrix} \}, \quad \{ \begin{bmatrix} 0 & a \\ 0 & 0 \end{bmatrix} \begin{bmatrix} 0 & 0 \\ 0 & b \end{bmatrix} \begin{bmatrix} 0 & 0 \\ 0 & c \end{bmatrix} \}.\]
Lemma 2.5. For $a, b, c \in A$, there exists $z \in A$ such that

$$\{ \begin{bmatrix} a & 0 \\ 0 & b \\ 0 & c \end{bmatrix} \} = \{ z \}.$$  

Proof. Let $X$ denote $\{ \begin{bmatrix} a & 0 \\ 0 & b \\ 0 & c \end{bmatrix} \}$. By (5), $(P_{12} + P_{22})(X) = 0$ and $(P_{12} + P_{21})(X) = 0$. \hfill \Box

Lemma 2.6. For $a, b, c \in A$,

$$\{ \begin{bmatrix} 0 & a \\ 0 & b \\ 0 & c \end{bmatrix} \} = \{ 0 \cdot abc \}.$$  

Proof. Since $P_{11} + P_{12}$ and $P_{12} + P_{22}$ are bicontractive, the intersection of their ranges is a subtriple. Since $A$ is a $JB^*$-triple under the product induced by $P_{12}$, and triple products are unique, the result follows. \hfill \Box

Definition 2.7. Define a ternary product $[a, b, c]$ or $[abc]$ on $A$ by

$$[a, b, c] = 2p_{11}(\{ \begin{bmatrix} 0 & a \\ 0 & b \\ 0 & c \end{bmatrix} \}),$$

where $p_{11}(\begin{bmatrix} a & b \\ c & d \end{bmatrix}) = a$. Similarly, define two more ternary products $(abc)$ and $(\langle abc \rangle)$ as follows:

$$\langle abc \rangle = 2p_{11}(\{ \begin{bmatrix} 0 & 0 \\ 0 & 0 \\ 0 & 0 \end{bmatrix} \} + \{ \begin{bmatrix} 0 & a \\ 0 & 0 \\ 0 & 0 \end{bmatrix} \}$$

(16)

and

$$\langle abc \rangle = 2p_{11}(\{ \begin{bmatrix} 0 & 0 \\ 0 & 0 \\ 0 & 0 \end{bmatrix} \} + \{ \begin{bmatrix} 0 & 0 \\ 0 & b \\ 0 & c \end{bmatrix} \}.$$  

We treat first the ternary product $[a, b, c]$. Note that, by Lemma 2.5,

$$\frac{1}{2} \{ [a, b, c] 0 \} = \{ \begin{bmatrix} 0 & a \\ 0 & b \\ 0 & c \end{bmatrix} \} + \{ \begin{bmatrix} 0 & 0 \\ 0 & 0 \\ 0 & 0 \end{bmatrix} \},$$

(20)

and that by interchanging suitable rows and columns,

$$\{ a, b, c \} = 2p_{21}(\{ \begin{bmatrix} 0 & 0 \\ 0 & a \\ 0 & 0 \end{bmatrix} \} + \{ \begin{bmatrix} 0 & 0 \\ 0 & 0 \\ 0 & 0 \end{bmatrix} \})$$

$$= 2p_{12}(\{ \begin{bmatrix} 0 & 0 \\ 0 & b \\ 0 & c \end{bmatrix} \} + \{ \begin{bmatrix} 0 & 0 \\ 0 & 0 \\ 0 & 0 \end{bmatrix} \})$$

$$= 2p_{22}(\{ \begin{bmatrix} 0 & 0 \\ 0 & 0 \\ 0 & 0 \end{bmatrix} \} + \{ \begin{bmatrix} 0 & 0 \\ 0 & 0 \\ 0 & 0 \end{bmatrix} \}).$$

Lemma 2.8. For $a, b, c \in A$,

$$[a, b, c] + [c, b, a] = 2\{ abc \},$$

and hence

$$\|[a, a, a]|| = ||a||^3.$$
Proof. Given \( a, b, c \in A \), it follows from Lemma 2.2, Lemmas 2.4-2.6, Definition 2.7 and (6) that there are elements \( x, y, z, w \in A \) such that \( x + y = 2\{abc\} \) and

\[
\begin{bmatrix}
  x & y \\
  z & w \\
\end{bmatrix} = \begin{bmatrix}
  0 & 0 \\
  0 & 0 \\
\end{bmatrix} + \begin{bmatrix}
  [abc]/2 & 0 \\
  0 & 0 \\
\end{bmatrix} + \begin{bmatrix}
  0 & \{abc\} \\
  0 & 0 \\
\end{bmatrix} + \begin{bmatrix}
  \{cba\}/2 & 0 \\
  0 & 0 \\
\end{bmatrix}.
\]

Hence \([abc]/2 + [cba]/2 = x + y = \{abc\} \) (and \( z = w = 0 \)).  

We shall see later in Proposition 3.5 that in fact \([abc] = (abc) = \langle abc \rangle\). First we shall show the analog of Lemma 2.8 for each of the ternary products \((abc)\) and \(\langle abc \rangle\). We note that, as above,

\[
\begin{bmatrix}
  (abc)/2 & 0 \\
  0 & 0 \\
\end{bmatrix} = \begin{bmatrix}
  a & 0 \\
  0 & b \\
\end{bmatrix} \begin{bmatrix}
  0 & 0 \\
  0 & c \\
\end{bmatrix} = \begin{bmatrix}
  0 & 0 \\
  0 & a \\
\end{bmatrix},
\]

and

\[
\begin{bmatrix}
  \langle abc \rangle/2 & 0 \\
  0 & 0 \\
\end{bmatrix} = \begin{bmatrix}
  0 & 0 \\
  0 & b \\
\end{bmatrix} \begin{bmatrix}
  0 & a \\
  0 & 0 \\
\end{bmatrix}.
\]

Moreover,

\[
(abc) = 2p_{22}(\begin{bmatrix}
  0 & 0 \\
  0 & a \\
\end{bmatrix} \begin{bmatrix}
  0 & b \\
  0 & 0 \\
\end{bmatrix} \begin{bmatrix}
  0 & c \\
  0 & 0 \\
\end{bmatrix})
\]

\[
= 2p_{22}(\begin{bmatrix}
  0 & c \\
  0 & 0 \\
\end{bmatrix} \begin{bmatrix}
  0 & b \\
  0 & 0 \\
\end{bmatrix} \begin{bmatrix}
  0 & 0 \\
  0 & a \\
\end{bmatrix})
\]

\[
= 2p_{12}(\begin{bmatrix}
  0 & a \\
  0 & 0 \\
\end{bmatrix} \begin{bmatrix}
  0 & 0 \\
  0 & b \\
\end{bmatrix} \begin{bmatrix}
  0 & a \\
  0 & c \\
\end{bmatrix})
\]

\[
= 2p_{21}(\begin{bmatrix}
  0 & 0 \\
  a & 0 \\
\end{bmatrix} \begin{bmatrix}
  b & 0 \\
  0 & 0 \\
\end{bmatrix} \begin{bmatrix}
  c & 0 \\
  0 & 0 \\
\end{bmatrix})
\]

and

\[
(\langle abc \rangle) = 2p_{22}(\begin{bmatrix}
  0 & c \\
  0 & 0 \\
\end{bmatrix} \begin{bmatrix}
  b & 0 \\
  0 & 0 \\
\end{bmatrix} \begin{bmatrix}
  0 & a \\
  0 & 0 \\
\end{bmatrix})
\]

\[
= 2p_{12}(\begin{bmatrix}
  0 & 0 \\
  0 & c \\
\end{bmatrix} \begin{bmatrix}
  b & 0 \\
  0 & 0 \\
\end{bmatrix} \begin{bmatrix}
  0 & a \\
  0 & 0 \\
\end{bmatrix})
\]

\[
= 2p_{21}(\begin{bmatrix}
  0 & c \\
  0 & 0 \\
\end{bmatrix} \begin{bmatrix}
  b & 0 \\
  0 & 0 \\
\end{bmatrix} \begin{bmatrix}
  0 & a \\
  0 & 0 \\
\end{bmatrix}).
\]

Proposition 2.9. If \( A \) is an operator space such that \( M_2(A) \) is a bounded symmetric domain (and consequently \( M_2(A) \) and \( A \) are JB*-triples), then \( (abc) + \langle cba \rangle = 2\{abc\}_A \) and \( (abc) + (cba) = 2\{abc\}_A \).
Proof. The proof for \( \langle \cdot , \cdot , \cdot \rangle \) is similar to the proof for \( \langle \cdot , \cdot \rangle \) using the identity
\[
\begin{bmatrix}
a & 0 \\
a & 0 \\
0 & b \\
0 & b \\
c & 0 \\
c & 0
\end{bmatrix}
= \begin{bmatrix}
0 & 0 \\
0 & 0 \\
0 & 0 \\
0 & 0 \\
0 & 0 \\
0 & 0
\end{bmatrix}
+ \begin{bmatrix}
c & 0 \\
0 & 0 \\
a & 0 \\
0 & 0 \\
a & 0 \\
0 & 0
\end{bmatrix}
+ \begin{bmatrix}
a & 0 \\
0 & 0 \\
a & 0 \\
0 & 0 \\
0 & 0 \\
0 & 0
\end{bmatrix}
+ \begin{bmatrix}
a & 0 \\
0 & 0 \\
0 & 0 \\
0 & 0 \\
0 & 0 \\
0 & 0
\end{bmatrix}
\]
and the projection
\[
P(\begin{bmatrix}
a & b \\
c & d \\
0 & 0 \\
0 & 0 \\
0 & 0 \\
0 & 0
\end{bmatrix}) = \frac{1}{2} \begin{bmatrix}
a + c & 0 \\
a + c & 0
\end{bmatrix}.
\]
To prove the statement for \( \langle \cdot , \cdot \rangle \) consider (cf. Remark 2.1) the space
\[
\tilde{A} = \{ \tilde{a} = \begin{bmatrix}
a & a \\
a & a
\end{bmatrix} : a \in A \},
\]
which is a subtriple of \( M_2(A) \) since it is the range of a product \( QP \) of the bicontractive projections \( Q,P \) of Proposition 1.3(c). It follows as in the proof of Remark 2.1 that \( \tilde{A} \) is a \( JB^* \)-triple under the triple product \( \{ \cdot , \cdot , \cdot \} \) defined by \( \{ \tilde{a}\tilde{b}\tilde{c} \} = 4(\{abc\})^\circ \).
To see this, let \( D'(\tilde{x})\tilde{a} = \{ \tilde{x}\tilde{x}\tilde{a} \} \) and note that \( \|\tilde{x}\| = 2\|x\|, D'(\tilde{x})\tilde{a} = 4(D(x)a) \),
\[
e^{i\pi D'(\tilde{x})}\tilde{y} = (e^{i\pi D(x)} y) \text{ and that } (\lambda - D(\tilde{x}))^{-1}\tilde{y} = ((\lambda - D(x))^{-1}y)\tilde{y}.
\]
By the uniqueness of the triple product on \( M_2(A) \), \( \{ \tilde{a}\tilde{b}\tilde{c} \} = \{ \tilde{a}\tilde{b}\tilde{c} \} \). Hence (by expanding \( \{ \tilde{x}\tilde{y}\tilde{z} \} = \{ \begin{bmatrix}
x & x \\
y & y \\
z & z
\end{bmatrix} \}) into computable terms,
\[
(4\{xyz\}) = \{ \tilde{x}\tilde{y}\tilde{z} \}
\]
\[
= \{\{xyz\} + (xyz)/2 + (zyx)/2 + [xyz]/2 + [zyx]/2 + \langle xyz \rangle/2 + \langle zyx \rangle/2 \}
\]
\[
= \{3\{xyz\} + \langle xyz \rangle/2 + \langle zyx \rangle/2 \}.
\]
This proves the statement for \( \langle \cdot , \cdot \rangle \).
\]

3. Equality of the ternary products

In this section, we continue to assume that \( A \subset B(H) \) is an operator space such that the open unit ball \( M_2(A)_0 \) is a bounded symmetric domain. We shall prove the equality of the three ternary products defined in section 2. Even though they agree, all three products are needed in the proof of the crucial Proposition 4.1.

In the following we shall let \( a \in M_2(A) \) denote \( \begin{bmatrix}
a & 0 \\
a & 0
\end{bmatrix} \) and \( \pi \in M_2(A) \) denote \( \begin{bmatrix}
a & a \\
a & 0
\end{bmatrix} \). Since the ranges of \( P_{12} + P_{21} \) and \( P_{11} + P_{22} \) are subtriples, they are invariant under the continuous functional calculus in a \( JB^* \)-triple. In particular, for any \( \lambda > 0 \),
\[
a^\lambda = \begin{bmatrix}
\lambda & 0 \\
0 & \lambda
\end{bmatrix}
\]
and \( (\pi)^\lambda = \begin{bmatrix}
0 & \lambda \\
\lambda & 0
\end{bmatrix} \).
Here, \( a^\lambda \) is defined by the triple functional calculus in the \( JB^* \)-triple \( M_2(A) \) and \( a^\lambda \) is defined by the triple functional calculus in the \( JB^* \)-triple \( A \).
**Lemma 3.1.** Let $\lambda, \mu, \nu$ be positive numbers and let $a \in A$. Then

$$a^{\lambda+\mu+\nu} = \{a^\lambda a^\mu a^\nu\} = \{a^\lambda a^\mu a^\nu\}$$

and

$$\bar{\Phi}^{\lambda+\mu+\nu} = \{\bar{\Phi}^{\lambda+\mu+\nu}\} = \{a^\lambda a^\mu a^\nu\}.$$  

**Proof.** $a^{\lambda+\mu+\nu} = \{a^\lambda a^\mu a^\nu\}$ is immediate from the functional calculus. The proofs of the other statements are all proved in the same way, for example,

$$\{a^\lambda a^\mu a^\nu\} = \left\{ \begin{bmatrix} 0 & a^\lambda \\ a^\mu & 0 \end{bmatrix} \begin{bmatrix} 0 & a^\nu \\ 0 & a^\mu \end{bmatrix} \begin{bmatrix} 0 & a^\nu \\ 0 & a^\mu \end{bmatrix} \right\} =$$

$$\left\{ \begin{bmatrix} 0 & a^\lambda \\ 0 & 0 \end{bmatrix} \begin{bmatrix} 0 & a^\nu \\ 0 & 0 \end{bmatrix} \begin{bmatrix} 0 & a^\nu \\ 0 & 0 \end{bmatrix} \right\} + \left\{ \begin{bmatrix} 0 & a^\lambda \\ 0 & 0 \end{bmatrix} \begin{bmatrix} 0 & 0 \\ a^\mu & 0 \end{bmatrix} \begin{bmatrix} 0 & a^\nu \\ a^\mu & 0 \end{bmatrix} \right\} + \left\{ \begin{bmatrix} a^\lambda & 0 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} a^\mu & 0 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} 0 & a^\nu \\ 0 & a^\mu \end{bmatrix} \right\} + \left\{ \begin{bmatrix} a^\lambda & 0 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} 0 & 0 \\ a^\mu & 0 \end{bmatrix} \begin{bmatrix} 0 & a^\nu \\ 0 & a^\mu \end{bmatrix} \right\},$$

which further expands, using (10) and (12)-(14) into

$$\left\{ \begin{bmatrix} 0 & 0 \\ a^\mu & 0 \end{bmatrix} \begin{bmatrix} 0 & 0 \\ 0 & a^\nu \end{bmatrix} \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix} \right\} + \left\{ \begin{bmatrix} 0 & a^\lambda \\ 0 & 0 \end{bmatrix} \begin{bmatrix} 0 & 0 \\ a^\mu & 0 \end{bmatrix} \begin{bmatrix} 0 & 0 \\ 0 & a^\nu \end{bmatrix} \right\} + \left\{ \begin{bmatrix} a^\lambda & 0 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} a^\mu & 0 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} 0 & a^\nu \\ 0 & 0 \end{bmatrix} \right\} + \left\{ \begin{bmatrix} a^\lambda & 0 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} 0 & 0 \\ a^\mu & 0 \end{bmatrix} \begin{bmatrix} 0 & a^\nu \\ 0 & a^\mu \end{bmatrix} \right\} = a^{\lambda+\mu+\nu}. \quad \square$$

**Lemma 3.2.** $D(a,a) = D(\bar{a},\bar{a}).$

**Proof.** We shall use (3) with $z = \{xy\}$, which states that

$$D(\{xy\}, \{xy\}) = 2D(x, \{xy\}) - D(\{x\{xy\}x\}, y).$$

We have, by (24) and Lemma 3.1,

$$D(a,a) = D(\bar{a}^{\beta/3}, \bar{a}^{\beta/3}, \bar{a}^{\beta/3}) = D(\bar{a}^{\beta/3}, \{\bar{a}^{\beta/3}, \bar{a}^{\beta/3}, \bar{a}^{\beta/3}\}).$$

We have, by (24) and Lemma 3.1,

$$D(a,a) = 2D(\bar{a}^{\beta/3}, \{\bar{a}^{\beta/3}, \bar{a}^{\beta/3}, \bar{a}^{\beta/3}\}).$$
which proves the lemma. \qed

**Lemma 3.3.** \( D(\mathbf{a}, \mathbf{a}) = D(\mathbf{a}, \mathbf{a}) \).

**Proof.** By two applications of (1) and Lemma 3.1 we have

\[
D(\mathbf{a}, \mathbf{a}) = D(\{a^{1/4}, \mathbf{a}^{1/4}, \mathbf{a}^{1/2}\}, \mathbf{a}) = D(\{a^{1/4}, \mathbf{a}^{1/4}, \mathbf{a}^{1/4}\}) + [D(a^{1/4}, \mathbf{a}^{1/4}), D(\mathbf{a}^{1/2}, \mathbf{a})] = D(\{a^{1/2}, \mathbf{a}^{3/2}\}, a) = \] (by Lemma 3.2 since \( D(\mathbf{a}^{1/2}, \mathbf{a}) = D(\mathbf{a}^{1/4}, \mathbf{a}^{1/4}) \))

\[
= D(\{a^{1/2}, a^{3/2}\}, a) - D(a^{1/2}, \{a^{1/4}, a^{1/2}\}) = D(\mathbf{a}, \mathbf{a}) - D(a^{1/2}, \mathbf{a}^{3/2}).
\]

Hence \( D(\mathbf{a}, \mathbf{a}) - D(\mathbf{a}, \mathbf{a}) = D(\mathbf{a}^{1/2}, \mathbf{a}^{3/2}) - D(\mathbf{a}^{1/2}, \mathbf{a}^{3/2}). \)

It remains to show that \( D(\mathbf{a}, \mathbf{a}^3) = D(\mathbf{a}, \mathbf{a}^3) = 0 \) for every \( a \in A \).

Now by (3) and Lemma 3.1,

\[
D(\mathbf{a}, \mathbf{a}^3) = D(\mathbf{a}, \{a, \mathbf{a}, \mathbf{a}\}) = D(\{a\mathbf{a}^3\}, \mathbf{a}^{1/2} + D(\mathbf{a}^3, \mathbf{a})/2 = D(a^3, \mathbf{a})/2 + D(\mathbf{a}^3, \mathbf{a})/2 = D(\mathbf{a}, \mathbf{a}^3) \) (by interchanging \( a \) and \( \mathbf{a} \)).
\]

This proves the lemma. \qed

By linearization from the preceding two lemmas we obtain

**Lemma 3.4.** \( D(\mathbf{a}, \mathbf{b}) = D(\mathbf{a}, \mathbf{b}) = D(\mathbf{a}, \mathbf{b}) \)

**Proof.** From \( D(\mathbf{a} + \mathbf{b}, \mathbf{a} + \mathbf{b}) = D(\mathbf{a} + \mathbf{b}, \mathbf{a} + \mathbf{b}) \) follows \( D(\mathbf{a}, \mathbf{b}) + D(\mathbf{a}, \mathbf{b}) = D(\mathbf{a}, \mathbf{b}) + D(\mathbf{b}, \mathbf{a}) \). Now replace \( a \) by \( ia \) and add to obtain \( D(\mathbf{a}, \mathbf{b}) = D(\mathbf{b}, \mathbf{a}) \). The second statement follows similarly from \( D(\mathbf{a} + \mathbf{b}, \mathbf{a} + \mathbf{b}) = D(\mathbf{a} + \mathbf{b}, \mathbf{a} + \mathbf{b}) \). \qed

**Proposition 3.5.** If \( A \) is an operator space such that \( M_2(A)_c \) is a bounded symmetric domain, then \( [abc] = (abc) = (abc) \)

**Proof.** By expanding as in the second part of the proof of Lemma 3.3,

\[
D(\mathbf{a}, \mathbf{b}) \begin{bmatrix} x & 0 \\ 0 & 0 \end{bmatrix} = \{ \begin{bmatrix} a & 0 \\ 0 & a \end{bmatrix} \begin{bmatrix} b & 0 \\ 0 & b \end{bmatrix} \begin{bmatrix} x & 0 \\ 0 & 0 \end{bmatrix} \} = \{ \begin{bmatrix} a & 0 \\ 0 & a \end{bmatrix} \begin{bmatrix} b & 0 \\ 0 & b \end{bmatrix} \begin{bmatrix} x & 0 \\ 0 & 0 \end{bmatrix} \} = \{ \begin{bmatrix} abx \end{bmatrix} \begin{bmatrix} 0 \\ 0 \end{bmatrix} \}
\]

and

\[
D(\mathbf{a}, \mathbf{b}) \begin{bmatrix} x & 0 \\ 0 & 0 \end{bmatrix} = \{ \begin{bmatrix} 0 & a \\ a & 0 \end{bmatrix} \begin{bmatrix} 0 & b \\ b & 0 \end{bmatrix} \begin{bmatrix} x & 0 \\ 0 & 0 \end{bmatrix} \} = \{ \begin{bmatrix} 0 & a \\ a & 0 \end{bmatrix} \begin{bmatrix} 0 & b \\ b & 0 \end{bmatrix} \begin{bmatrix} x & 0 \\ 0 & 0 \end{bmatrix} \} + \{ \begin{bmatrix} 0 & 0 \\ a & 0 \end{bmatrix} \begin{bmatrix} 0 & 0 \\ b & 0 \end{bmatrix} \begin{bmatrix} x & 0 \\ 0 & 0 \end{bmatrix} \} = \{ [abx]/2 + (xba)/2 \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix} \}.
\]
so that \([xba] = (xba)\).
Similarly,

\[
\begin{bmatrix}
0 & \langle xba \rangle/2 \\
\langle abx \rangle/2 & 0
\end{bmatrix} = \begin{bmatrix}
0 & a \\
a & 0
\end{bmatrix} \begin{bmatrix}
0 & b \\
b & 0
\end{bmatrix} \begin{bmatrix}
x & 0 \\
0 & 0
\end{bmatrix} = D(a, b) \begin{bmatrix}
x & 0 \\
0 & 0
\end{bmatrix} = \begin{bmatrix}
0 & x \\
x & 0
\end{bmatrix} = \begin{bmatrix}
0 & \langle xba \rangle/2 \\
\langle abx \rangle/2 & 0
\end{bmatrix},
\]

so that \(\langle xba \rangle = [xba]\).

\[\square\]

4. Main result

**Proposition 4.1.** Let \(A\) be an operator space such that \(M_2(A)\) is a bounded symmetric domain. Then \((A, \cdot, ||\cdot||)\) is a \(C^*\)-ternary ring in the sense of Zettl [35] (see Definition 1.2) and its \(JB^*\)-triple product (see the beginning of section 2) satisfies \(\{abc\} = ([abc] + [cba])/2\).

**Proof.** It was already shown in Lemma 2.8 that \(\{abc\} = ([abc] + [cba])/2\) and that \(||[aaa]| = ||a||^3\) and it is clear that \(||[abc]| \leq ||a|| ||b|| ||c||\).

It remains to show associativity. To prove this we will use Lemma 2.3 and Proposition 3.5. For \(a, b, c, d, e \in A\), let

\[
A = \begin{bmatrix}
0 & a \\
a & 0
\end{bmatrix}, B = \begin{bmatrix}
0 & b \\
b & 0
\end{bmatrix}, C = \begin{bmatrix}
c & 0 \\
0 & 0
\end{bmatrix}, D = \begin{bmatrix}
0 & 0 \\
0 & d
\end{bmatrix}, E = \begin{bmatrix}
e & 0 \\
0 & 0
\end{bmatrix}.
\]

Then

\[
[abc]de = ([abc]de) = 2p_{11}(\begin{bmatrix}
[abc] & 0 \\
& 0
\end{bmatrix}, \begin{bmatrix}
0 & 0 \\
0 & d
\end{bmatrix}, \begin{bmatrix}
0 & 0 \\
e & 0
\end{bmatrix}) \text{ (by (16))}
= 4p_{11}(\begin{bmatrix}
0 & a \\
0 & 0
\end{bmatrix}, \begin{bmatrix}
0 & b \\
0 & 0
\end{bmatrix}, \begin{bmatrix}
c & 0 \\
0 & 0
\end{bmatrix}, \begin{bmatrix}
0 & 0 \\
0 & d
\end{bmatrix}, \begin{bmatrix}
0 & 0 \\
e & 0
\end{bmatrix}) \text{ (by (20))}
= 4p_{11}(\{ED\{CBA\}\}) \text{ (by commutativity of the triple product)}
= 4p_{11}(\{CB\{EDA\}\}) + 4p_{11}(\{EDC\}BA)
- 4p_{11}(\{C\{BED\}A\}) \text{ (by (2))}
= 0 + 4p_{11}(\begin{bmatrix}
0 & 0 \\
& 0
\end{bmatrix}, \begin{bmatrix}
0 & 0 \\
0 & d
\end{bmatrix}, \begin{bmatrix}
0 & c \\
& 0
\end{bmatrix}, \begin{bmatrix}
0 & 0 \\
0 & 0
\end{bmatrix}, \begin{bmatrix}
0 & 0 \\
e & 0
\end{bmatrix}) + 0
= 2p_{11}(\begin{bmatrix}
0 & a \\
0 & 0
\end{bmatrix}, \begin{bmatrix}
0 & b \\
0 & 0
\end{bmatrix}, \begin{bmatrix}
(cde) & 0 \\
& 0
\end{bmatrix}) \text{ (by (22))}
= [ab(cde)] = [abcde].
To complete the proof of associativity, consider
\[ [a[deb]c] = (a(debc)) \]
\[ = 2p_1\left(\begin{bmatrix} 0 & a \\ 0 & 0 \end{bmatrix} \begin{bmatrix} 0 & 0 \\ d & 0 \end{bmatrix} \begin{bmatrix} 0 & 0 \\ c & 0 \end{bmatrix} \right) \] (by (19))
\[ = 4p_1\left(\begin{bmatrix} 0 & a \\ 0 & 0 \end{bmatrix} \begin{bmatrix} 0 & 0 \\ c & 0 \end{bmatrix} \right)
\begin{bmatrix} 0 & b \\ 0 & 0 \end{bmatrix} \right) \right) \] (by (23))
\[ = 4p_1\{A\{DECB\}E\})
\[ = 4p_1\{\{ABC\}DE\} + 4p_1\{EB\{ADC\}\} - 4p_1\{C\{BAD\}E\}
\] (by (4))
\[ = 4p_1\{\{ABC\}DE\} \) \text{(since A \perp D)}
\[ = 4p_1\left(\begin{bmatrix} 0 & a \\ 0 & 0 \end{bmatrix} \begin{bmatrix} 0 & b \\ d & 0 \end{bmatrix} \right) \right) \right) \] (by (23))
\[ = [abcde]. \]

We now state and prove the main result of this paper.

**Theorem 4.2.** Let \( A \subset B(H) \) be an operator space and suppose that \( M_n(A)_0 \) is a bounded symmetric domain for some \( n \geq 2 \). Then \( A \) is \( \pi \)-isometric to a ternary ring of operators (TRO). If \( M_n(A)_0 \) is a bounded symmetric domain for all \( n \geq 2 \), then \( A \) is ternary isomorphic and completely isometric to a TRO.

**Proof.** The second statement follows from the first one. Suppose \( n = 2 \). From Zettl's theorem and Proposition 4.1, we know that \( A = A_1 \oplus \infty A_1 \) where \( A_1 \) is ternary isomorphic and isometric to a TRO \( B \) and \( A_1 \) is anti-isomorphic and isometric to a TRO \( C \). However, since \( C \) is a JB*-triple under the product \( \{x \ y \ z\} = (1/2)(xy^*z + zy^*x) \) and all isometries of JB*-triples are triple isomorphisms, it follows that \( A_1 = 0 \). Hence \( A \) is ternary isomorphic to a TRO \( B \).

Let \( \phi : A \rightarrow B \) be a surjective ternary isomorphism. Then the amplification \( \phi_2 \) is a triple isomorphism of the JB*-triple \( M_2(A) \) onto the JB*-triple \( M_2(B) \), with the triple product
\[ \{RST\}^{M_2(B)} := (RST + TST)/2. \]
Indeed, we may form the ternary product \( \{\cdot\cdot\cdot\}_{M_2(A)} \) induced by the ternary product on \( A \) and ordinary matrix multiplication. It is easy to see that this ternary product satisfies
\[ 2\{XYZ\}_{M_2(A)} = [XYZ]_{M_2(A)} + [ZYX]_{M_2(A)} \]
implying that \( \phi_2 \) is a triple isomorphism, hence an isometry. Thus, \( A \) is 2-isometric to \( B \), proving the theorem for \( n = 2 \).

The general case for \( M_n(A) \) is now not difficult to obtain. We require only one short lemma. In this lemma we use the notation \( \{a_{ij} \ a_{kj} \ a_{ij} \} \) to mean
\[ \{P_{ij}(a), P_{kj}(a), P_{ij}(a)\} \]
for \( a = [a_{ij}] \in M_2(A) \).
Lemma 4.3. Let $A$ be an operator space such that for some $n \geq 3$, $M_n(A)$ has a JB*-triple structure. Then the products $\{a_{ij} a_{kj} a_{ij}\}$ (for distinct $i,k,l$), $\{a_{ij} a_{ik} a_{kj}\}$ (for distinct $j,k,l$), and $\{a_{ij} a_{kl} a_{pq}\}$ (for $\{k,l\} \cap \{p,q\} = \emptyset$) all vanish.

Proof. Two applications of the fact that the range of a bicontractive projection on a JB*-triple is a subtriple yield that $\{a_{ij} a_{kj} a_{ij}\}$ lies in $(P_i + P_j + P_{i+j})M_n(A)$. However, by a local expectation property,

$$(P_i + P_j)\{a_{ij} a_{kj} a_{ij}\} = (P_i + P_j)\{a_{ij} a_{kj} 0\} = \{0\}.$$ 

A similar calculation shows $(P_k + P_j)\{a_{ij} a_{kj} a_{ij}\} = \{0\}$, proving the first statement. A similar argument proves the second statement. The proof of the last statement is the same as the proof of Lemma 2.3.

Returning to the proof of Theorem 4.2, if $M_n(A)$ is a JB*-triple, then $M_2(A)$, which is isometric to the range of a contractive projection on $M_n(A)$, is also a JB*-triple. Hence, by the $n = 2$ case, $A$ is a C*-ternary ring which is ternary isomorphic and isometric under a map $\phi$ to a TRO $B$ and $M_2(A)$ is triple isomorphic and isometric to $M_2(B)$ under the amplification $\phi_2$. Every triple product in $M_n(A)$ is the sum of products of the form $\{a_{ij} a_{kl} a_{pq}\}$. By Lemma 4.3, every such product of matrix elements in $M_n(A)$ is either zero or takes place in the intersection of two rows with two columns. The subspace of $M_n(A)$ defined by this intersection is completely isometric, hence triple isomorphic, to $M_2(A)$. Hence, by the proof of the $n = 2$ case, all triple products in $M_n(A)$ are the natural ones obtained from the ternary structure on $A$ and matrix multiplication. It follows that $M_n(A)$ is triple isomorphic to $M_n(B)$ via the amplification map $\phi_n$ which is thus an isometry.

As an application, we offer three corollaries.

Corollary 4.4. Let $A \subset B(H,K)$ be a TRO and let $P$ be a completely contractive projection on $A$. Then the range of $P$ is completely isometric to another TRO.

Proof. Since $A$ is a TRO, $M_n(A)$ is a JB*-triple. Therefore $M_n(P(A)) = P_n(M_n(A))$ is a JB*-triple, and its unit ball is a bounded symmetric domain.

Another way to obtain this corollary is to note that every TRO is a corner of a C*-algebra and hence the range of a completely contractive projection on that algebra. By composing these two projections, the corollary is reduced to [34].

For our second corollary we recall that a complex Banach space $A$ is isometrically isomorphic to a unital JB*-algebra if and only if its open unit ball $A_0$ is a bounded symmetric domain of tube type [8]. In [33], a necessary and sufficient condition, involving the Lie algebra of all complete holomorphic vector fields on $A_0$, is given for such $A$ to be obtained from a C*-algebra with the anticommutator product. Our next corollary gives a holomorphic characterization of C*-algebras up to complete isometry.

Corollary 4.5. Let $A \subset B(H)$ be an operator space and suppose that $M_n(A)_c$ is a bounded symmetric domain for some $n \geq 2$. If the induced bounded symmetric domain structure on $A_0$ is of tube type, then $A$ is $n$-isometric to a C*-algebra. If $M_n(A)_c$ is a bounded symmetric domain for all $n \geq 2$ and $A_0$ is of tube type, then $A$ is completely isometric to a C*-algebra.

Proof. By the theorem we may assume that $A$ is a TRO. Since $A$ has the structure of a unital JB*-algebra, there is a partial isometry $u \in A$ such that $au^*u = uu^*a = a$ for every $a \in A$. Then $A$ becomes a C*-algebra with product...
$a \cdot b = au^* b$ and involution $a^2 = ua^* u$. Since $ab^*c = a \cdot b^* \cdot c$, and ternary isomorphisms of TRO's are complete isometries, the result follows. \hfill \Box

Our final corollary is a variant of the fundamental Choi-Effros result.

**Corollary 4.6.** Let $P$ be a unital 2-positive projection on a unital $JC^*$-algebra $A$. Then $P(A)$ is 2-isometric to a $C^*$-algebra. If $P$ is completely positive and unital, then $P(A)$ is completely isometric to a $C^*$-algebra.

**Remark 4.7.** It is still an open question whether an operator space which is 2-isometric to a TRO (resp. $C^*$-algebra) is completely isometric to it. In the former case, by Theorem 4.2, this is the same as saying that if $M_2(A)_0$ is a bounded symmetric domain, then $M_n(A)_0$ is a bounded symmetric domain for every $n$.
