Assignment 6

1. Let $\Omega \subset \mathbb{R}^n$ be a bounded domain with smooth boundary and prove Poincaré's Inequality

$$\|u\|_{\mathcal{L}_p(\Omega)} \le c \|\nabla u\|_{\mathcal{L}_p(\Omega)}, \ u \in \overset{\circ}{\mathcal{W}}{}_p^1(\Omega).$$

What does the constant c depend on? Is the boundedness assumption really necessary?

2. Let $\Omega \subset \mathbb{R}^n$ and $p \in (1, \infty)$ and define

 $W_{p}^{m}(\Omega) = \left\{ u \in \mathcal{D}'(\Omega) \mid \partial^{\alpha} u \in L_{p}(\Omega), \ |\alpha| \leq m \right\}.$

Show that $\mathbf{W}_p^m(\Omega)$ is a Banach space if endowed with the norm $\|\cdot\|_{m,p}$ defined by

$$||u||_{m,p} = \left(\sum_{|\alpha| \le m} ||\partial^{\alpha} u||_{\mathbf{L}_{p}(\Omega)}^{p}\right)^{1/p}, \ u \in \mathbf{W}_{p}^{m}(\Omega).$$

Prove that $W_p^1(0,1) \hookrightarrow BUC^{1-1/p}([0,1])$. [Hint: Use the fact that $C^1([0,1])$ is dense in $W_p^1(0,1)$]

- 3. Prove that $\mathcal{S}(\mathbb{R}^n)$ is dense in $\mathrm{H}^s(\mathbb{R}^n)$ for $s \in \mathbb{R}$.
- 4. Let $\Omega = \mathbb{B}(0, 1/2)$ and the function u be defined through

$$u(x,y) = \log\left(\log(\frac{2}{\sqrt{x^2 + y^2}})\right), \ (x,y) \in \Omega \,.$$

Then u is obviously not continuous in (x, y) = (0, 0). Prove that, however, $u \in H^1(\Omega)$. Let now

$$u(x,y) = xy \left[\log \left| \log |(x,y)| \right| - \log \log 2 \right], \ (x,y) \in \Omega.$$

Show that

 $u \in \mathcal{C}^1(\overline{\Omega})$ and $\partial_i^2 u \in \mathcal{C}(\overline{\Omega}), \ j = 1, 2$

is a solution of the Dirichlet problem in the ball with continuous datum but $u \notin C^2(\overline{\Omega})$.

5. Let E be a Banach space and $A : \operatorname{dom}(A) \subset E \longrightarrow E$ a linear, possibly unbounded, operator on E. A is said to be invertible if there exists a bounded operator $B \in \mathcal{L}(E)$ such that

$$AB = \mathrm{id}_E$$
 and $BA = \mathrm{id}_{\mathrm{dom}(A)}$.

Such an operator A can fail to be invertible either because it has non trivial kernel (not injective)

$$\ker(A) \neq \{0\}$$

or because it is not surjective

$$\overline{R(A)} \neq E$$

but, also, because its "inverse" is unbounded. Let

$$E = l_2(\mathbb{N}) := \left\{ (x_j)_{j \in \mathbb{N}} \, | \, x_j \in \mathbb{R} \, \forall j \in \mathbb{N} \text{ and } \sum_{j=1}^{\infty} x_j^2 < \infty \right\}$$

with the norm naturally induced by the scalar product

$$(x|y) = \sum_{j=1}^{\infty} x_j y_j, \ x, y \in l_2(\mathbb{N}).$$

For each one of the ways described find an operator A on $l_2(\mathbb{N})$ which fails to be invertible in that and no other way. In general the set

$$\sigma(A) = \{\lambda \in \mathbb{C} \mid \lambda - A \text{ is not invertible}\} \subset \mathbb{C}$$

is called spectrum of A. Show that it is a closed set.
