

## Assignment 2

---

1. It can be shown that any distribution can be viewed as some derivative of a continuous function. More precisely

$$\forall u \in \mathcal{D}'(\Omega) \forall K = \overline{K} \subset \subset \Omega \exists f \in C(\Omega) \text{ and } \alpha \in \mathbb{N}^n \text{ s.t.}$$

$$\langle u, \varphi \rangle = (-1)^{|\alpha|} \int_{\Omega} f(x) \partial^{\alpha} \varphi(x) dx \quad \forall \varphi \in \mathcal{D}_K(\Omega).$$

For a proof see the book *Functional Analysis* by W. Rudin (p. 167). Let now  $\delta \in \mathcal{D}'(\mathbb{R}^2)$  and find a simple representation of it as some derivative of a continuous function.

2. For  $u \in \mathcal{D}'(\mathbb{R}^n)$  and  $v \in \mathbb{R}^n$  define  $\tau_v u \in \mathcal{D}'(\mathbb{R}^n)$  through

$$\langle \tau_v u, \varphi \rangle = \langle u, \tau_{-v} \varphi \rangle \quad \forall \varphi \in \mathcal{D}(\mathbb{R}^n)$$

where  $\tau_v \varphi = \varphi(\cdot - v)$ . Show that  $\tau_v u$  is well-defined and prove that

$$\frac{\tau_{-he_j} u - u}{h} \longrightarrow \partial_j u \text{ in } \mathcal{D}'(\mathbb{R}^n) \text{ as } h \rightarrow 0$$

for  $j = 1, \dots, n$ .

3. Let  $\varphi, \psi \in \mathcal{D}(\Omega)$  and  $\alpha \in \mathbb{N}^n$ . Determine the real numbers  $c_{\alpha\beta}$ ,  $\beta \leq \alpha$  for which the formula

$$\partial^{\alpha}(\varphi\psi) = \sum_{\beta \leq \alpha} c_{\alpha\beta} \partial^{\alpha-\beta} \varphi \partial^{\beta} \psi$$

holds. By  $\beta \leq \alpha$  it is meant that  $\beta_j \leq \alpha_j$  for  $j = 1, \dots, n$ .

4. Show that  $u \in \mathcal{D}'((0, \infty))$  given through

$$\langle u, \varphi \rangle := \sum_{m=1}^{\infty} (\partial^m \varphi)\left(\frac{1}{m}\right), \quad \varphi \in \mathcal{D}((0, \infty))$$

is well-defined. Show that  $u$  has infinite order and that it cannot be extended to a distribution of the real line.

5. Let  $\Omega \subset \mathbb{R}^n$  be an open and bounded domain with smooth boundary  $\partial\Omega$  and denote by  $\chi_{\Omega}$  its characteristic function. Compute  $\nabla \chi_{\Omega}$  in the sense of distributions and determine its support.
