V. Cristini (Dept Biomed Eng, UCI)

Motivation

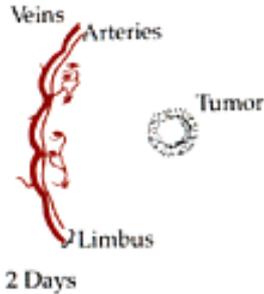

- Provide biophysically justified *in silico* virtual system to study
- Help experimental investigations; design new experiments
- Therapy protocols

Outline

- Review of tumor growth model
- Angiogenesis (experiment)
- Angiogenesis (model)
- Numerical implementation
- Results

Example of solid tumor growth

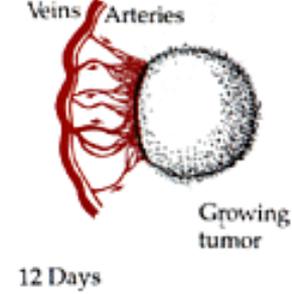

genetic mutations

Avascular growth
Diffusion dominated

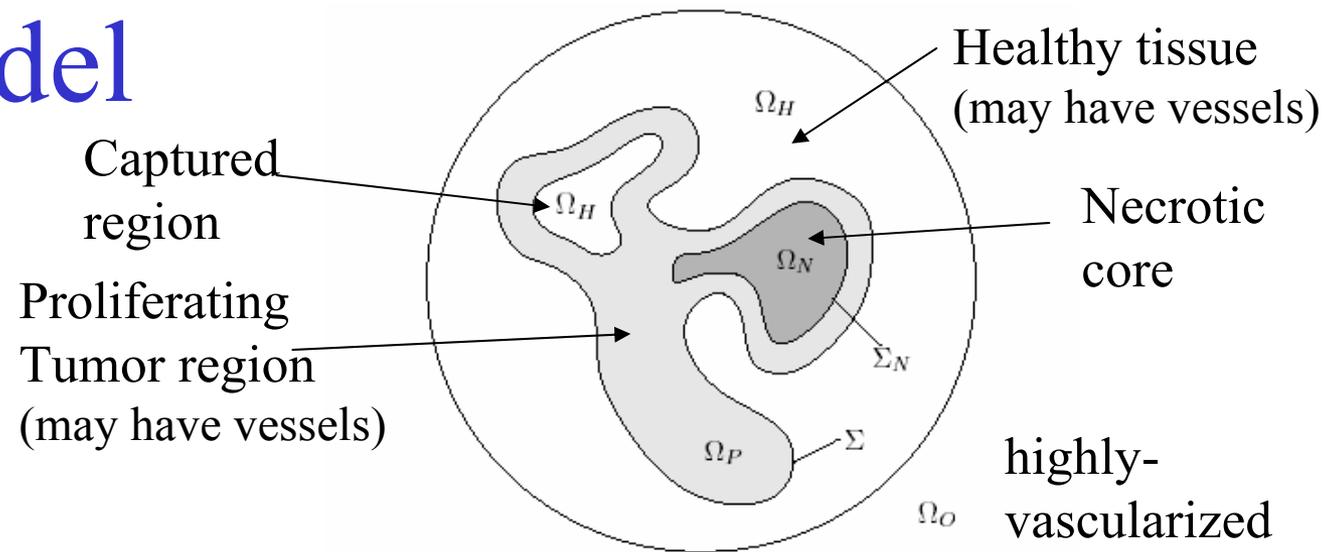

Angiogenesis

Vascular growth
invasive
metastasis
malignancy

- Goal: Model all Phases of growth

Present model

- Continuum approximation: super-cell macro scale
- Role of **cell adhesion and motility** on tissue invasion and metastasis
Idealized mechanical response of tissues
- **Coupling between growth and angiogenesis** (neo-vascularization):
necessary for maintaining uncontrolled cell proliferation
- **Genetic mutations**: random changes in microphysical parameters cell
apoptosis and adhesion
- **Limitations**: poor feedback from macro scale to micro scale
(Greenspan, Byrne & Chaplain, Anderson & Chaplain, Levine...)

Cell proliferation and tissue invasion

Greenspan, Chaplain, Byrne, ...

Assume constant tumor cell density:
cell velocity

Assume 1 diffusing nutrient of concentration σ

Cell proliferation: in the tumor is a balance of mitosis and apoptosis (mitosis is responsible for reproduction of mutated genes) and is one of the two main factors responsible for tissue invasion

Cell-to-cell adhesion

$$\nabla \cdot \mathbf{u} = \begin{cases} \lambda_M(\sigma) - \lambda_A & \text{in } \Omega_P \\ -\lambda_N & \text{in } \Omega_N = \{\mathbf{x} \mid \sigma(\mathbf{x}, t) \leq \sigma_N\} \end{cases}$$

viscosity

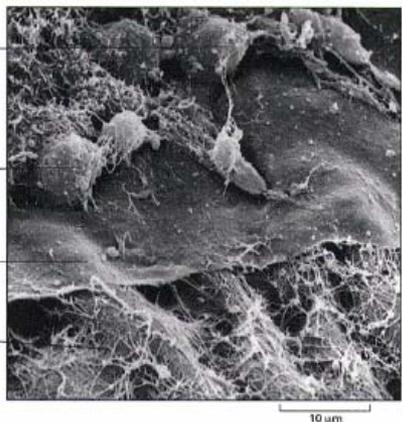

$$[[P]] = \tau \kappa \text{ on } \Sigma$$

Viability concentration

Darcy-Stokes

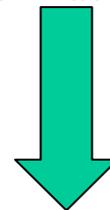

$$\mathbf{u} - \nu \Delta \mathbf{u} = -\mu \nabla P$$

Rate of enzymatic breakdown of necrotic cells (death due to lack of nutrient)

Cell mobility: reflect strength of cell adhesion to other cells and to the Extra-Cellular Matrix (ECM), the other main factor leading to tissue invasion

Spatial distribution of the oncotic pressure

Cell death responsible for release of angiogenic factors: INPUT TO ANGIOGENESIS

Evolution of nutrient: Oxygen/Glucose

Greenspan, Chaplain, Byrne, ...

=0 (quasi-steady assumption). Tumor growth time scale (~1 day) large compared to typical diffusion time (~1 min)

$$\frac{\partial \sigma}{\partial t} = \nabla \cdot (D \nabla \sigma) - \lambda_C \cdot \sigma + \lambda_B (\sigma_B - \sigma, P_B - P, \mathbf{x}, t)$$

Diffusion

nutrient concentration in blood

Oncotic pressure: affects blood flow and delivery of nutrients (and chemotherapy drugs)

Nutrient consumption by the cells

Blood-to-tissue nutrient transfer rate function. Spatial distribution of capillaries: **OUTPUT FROM ANGIOGENESIS**

More complex Biophysics

- Simplified cell-cycling model $\lambda_M(\sigma) = b\sigma$

- Blood-tissue transfer of nutrient

$$\lambda_B(\sigma_B - \sigma, P_B - P, \mathbf{x}, t) = \lambda_B h(\sigma_B - \sigma) \cdot (P_B - P)_+$$

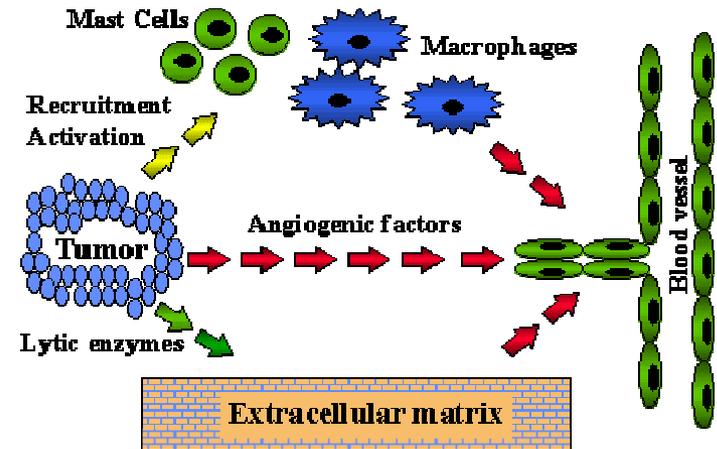

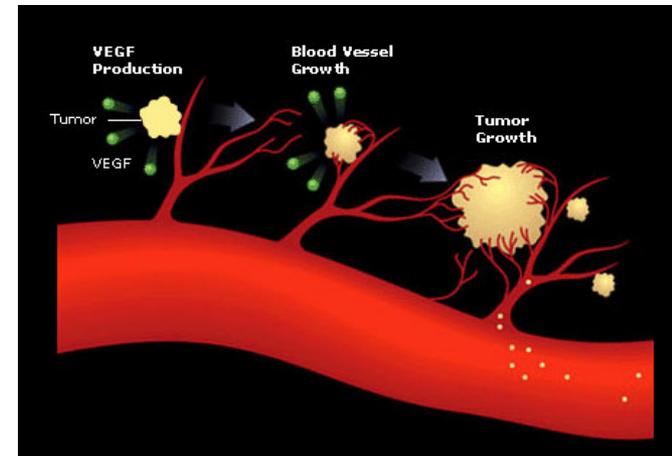

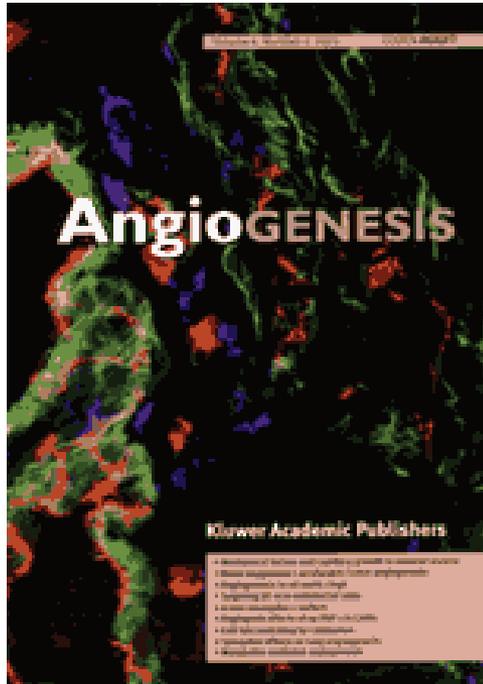

$$h(\sigma_B - \sigma) = (\sigma_B - \sigma) \delta_{Capillary}$$

- Avascular, angiogenesis and fully vascularized growth

- Nonlinear interaction between
developing vasculature and tumor
growth

Angiogenesis

Angiogenic factors:

VEGF (Vascular Endothelial cell Growth Factor)

FGF (Fibroblast Growth Factor)

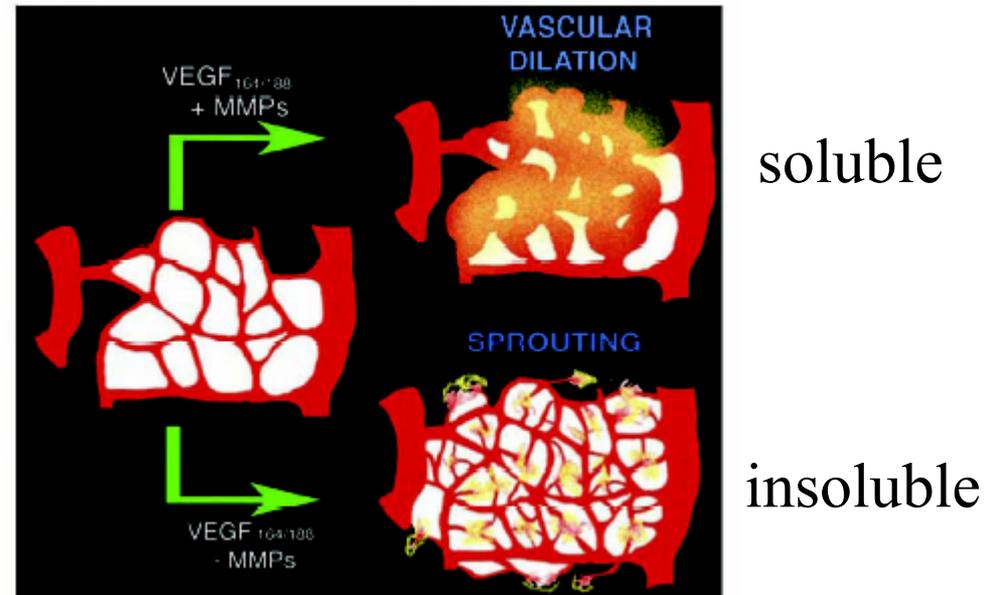

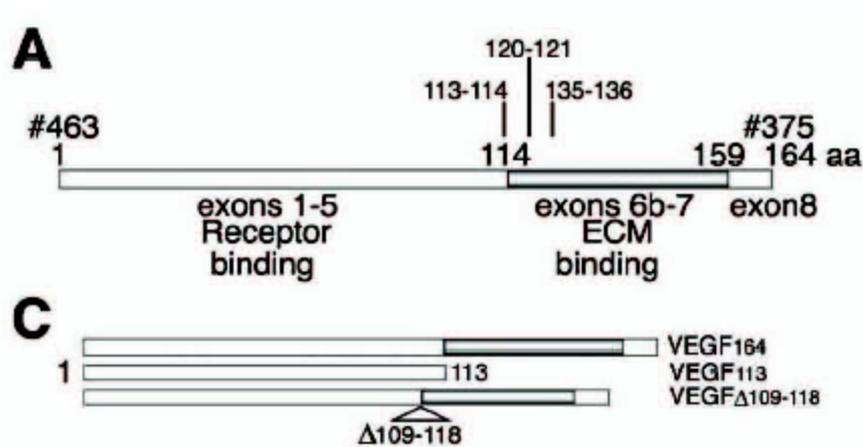

Angiogenin

TGF (Transforming Growth Factor),....

ECM/MMP Regulation of VEGF

Lee, Jilani, Nikolova, Carpizo, Iruela-Arispe JCB. 2005.

VEGF-A isoforms

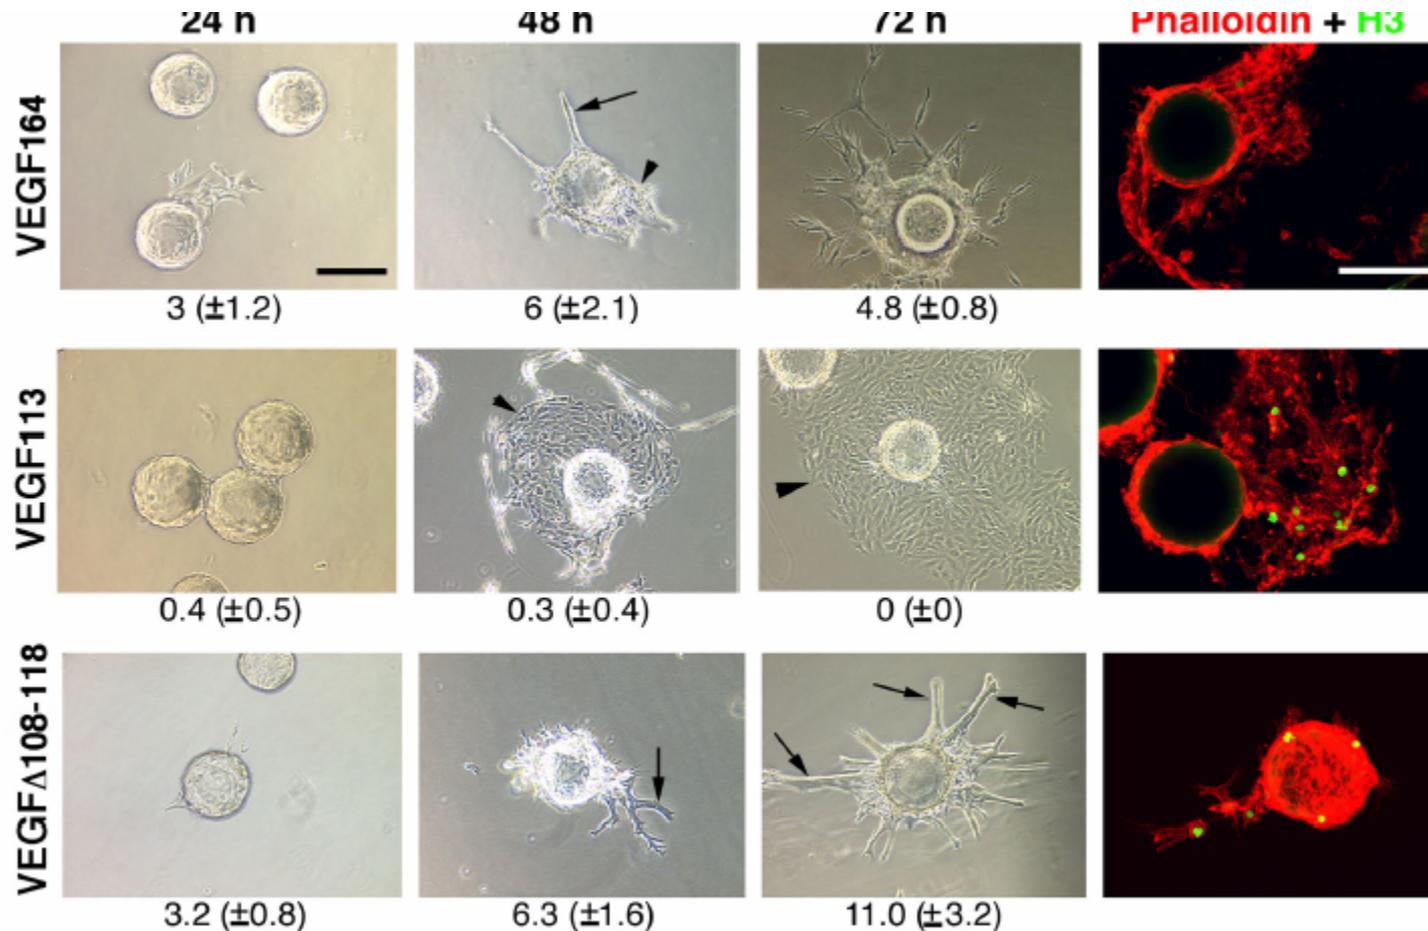

• Insoluble VEGF + Matrix Metalloproteinases (ECM) \longrightarrow Soluble VEGF + MMPs (Endothelial cells)

• Different signaling outcomes through VEGFR2

Effect on EC growth

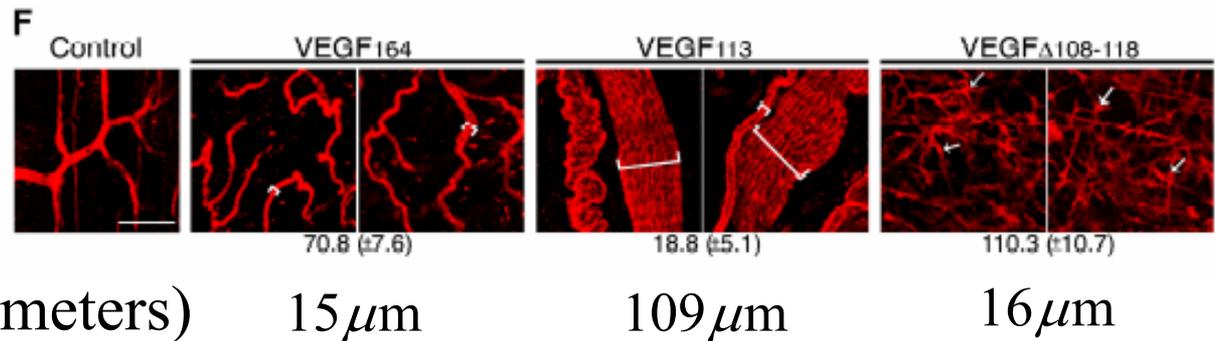

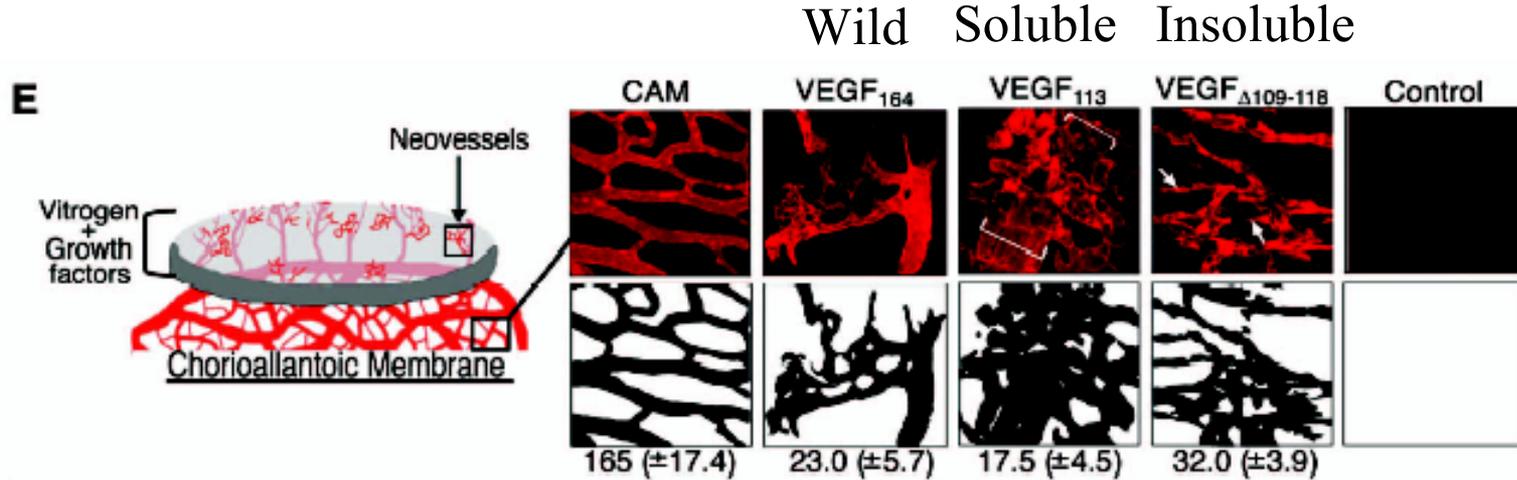

Beads containing cells embedded in fibrin/fibronectin gels

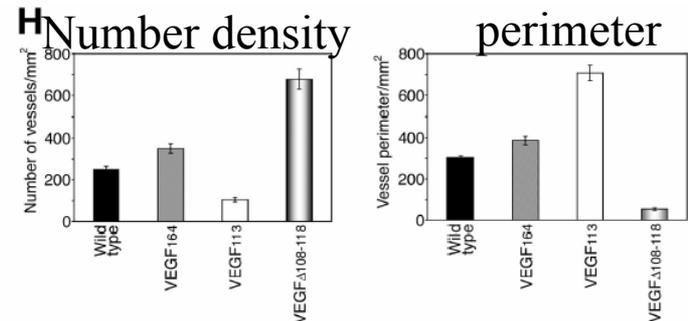

- VEGF 113: Sheets
- VEGFD108-118: Chords
- VEGF 164: Both

(stain to measure proliferation)

Effect on Vessel Morphology

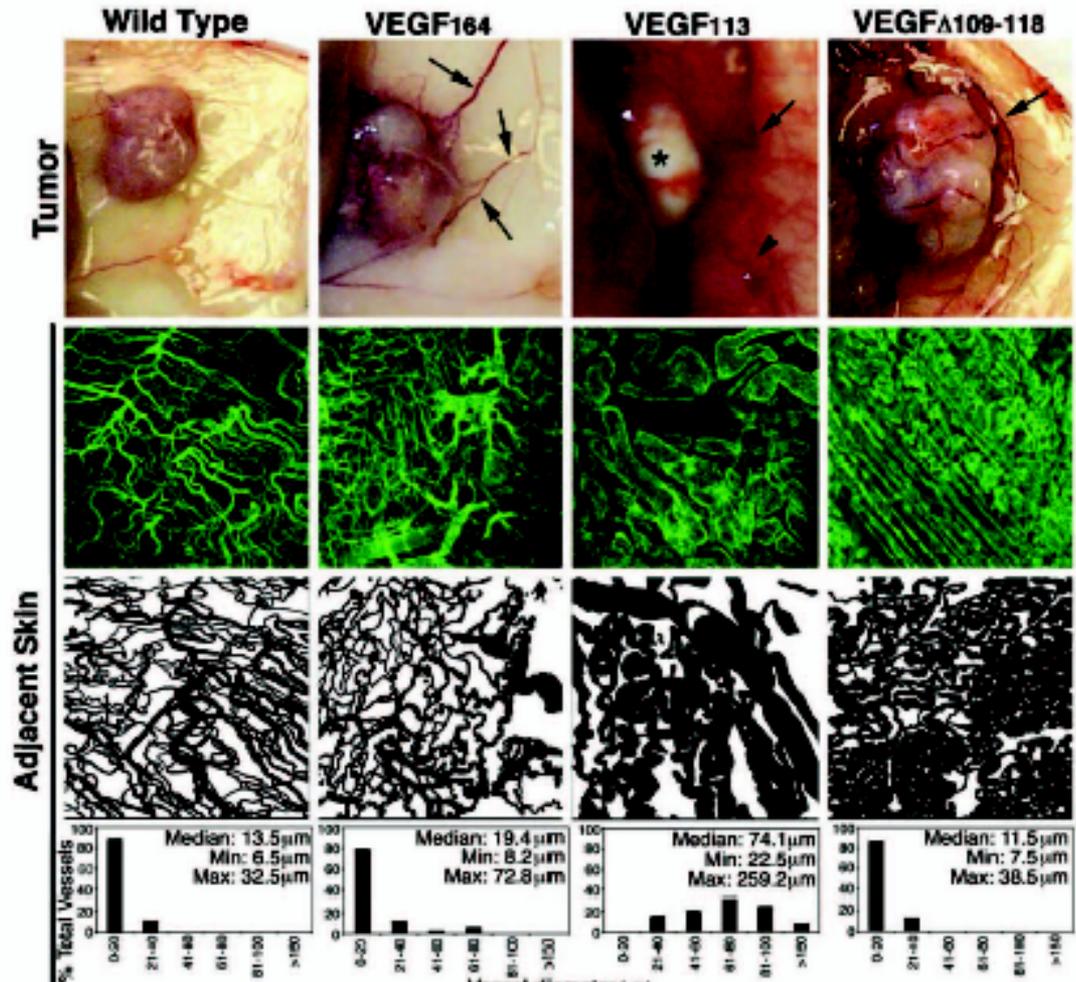

- Morphology strongly depends on type

Effect on tumor growth

- Soluble VEGF poor prognosticator of tumor progression
- Matrix-bound VEGF yields more efficient angiogenic response

Mathematical model

Anderson, Chaplain, Macdougall, Levine, Sleeman, Zheng, Wise, Cristini BMB 2005,...

Endothelial cell concentration e :

form the lining of the capillary

$$\frac{\partial e}{\partial t} = \bar{D}_e \nabla^2 e - \nabla \cdot \left(\left(\frac{\bar{\chi}_c}{1 + \alpha c / \bar{c}_0} \nabla c + \bar{\chi}_f \nabla f + \chi_{\mathbf{u}} \mathbf{u} \right) e \right) + \bar{\rho}_P \frac{e(\bar{e}_0 - e)}{\bar{e}_0} \mathcal{H}(c - \bar{c}^*) \frac{c - \bar{c}^*}{\bar{c}_0}$$

Chemotaxis
Haptotaxis

Proliferation

Tumor angiogenic factor (e.g., **VEGF-A**): potent mitogen, drives motion

Uptake by the endothelial cells

$$0 = \bar{D}_c \nabla^2 c - \bar{\beta}_D c - \bar{\beta}_U c e / \bar{e}_0,$$

$c = 1$ on Σ_N

Cell receptor ligand (e.g., **Fibronectin**) in the ECM. Regulates cell adhesion and motion

$$\frac{\partial f}{\partial t} = \eta_P e - \eta_U f e - \eta_N \mathcal{X}_{\Omega_N} f,$$

production degradation

• Recast in a biased random-walk model to follow the evolution of the capillaries (Anderson, Chaplain)

Numerical method

- Level-set/Finite-element formulation (Mixed methods, LDG, EPC)

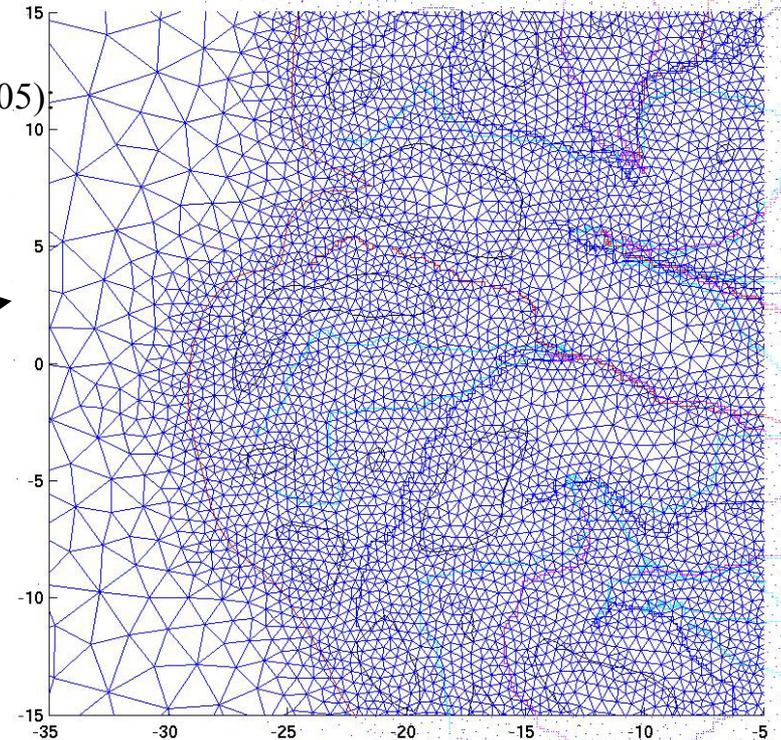

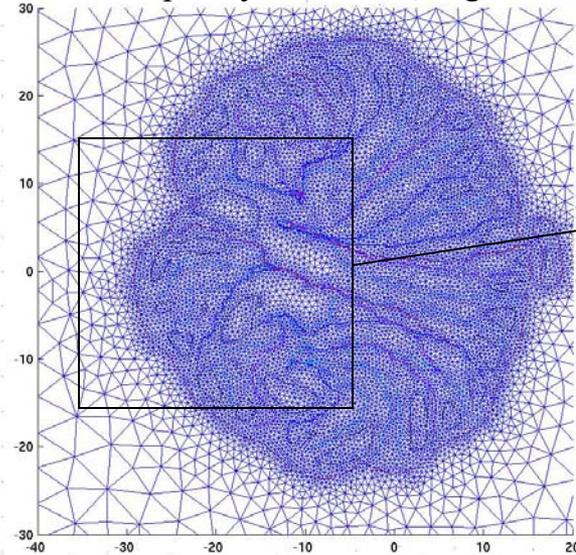

Zheng, Wise, Cristini, Bull. Math. Biol. 2005

Zheng, Anderson, Cristini, J. Comp. Phys. 2005

Zheng, Lowengrub, Anderson, Cristini, J. Comp. Phys. 2005

- Adaptive computational mesh

Cristini *et al.* J. Comp. Phys. 2001, Zheng *et al.* J. Comp. Phys (2005)

Mesh: System of springs (energy)

Local Operations \longrightarrow Minimum energy \longrightarrow Optimal mesh

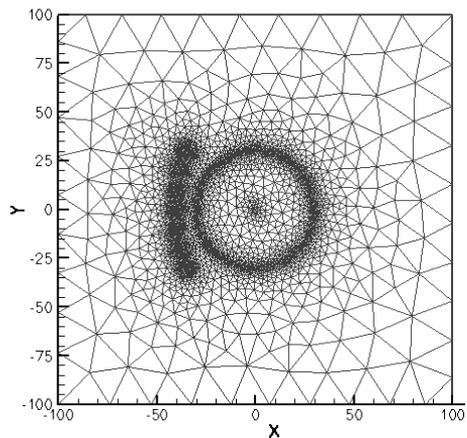

Resolution of physical scales

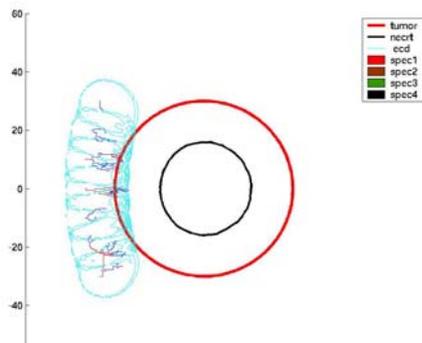

$$l_{eq} = \min(l_1, l_2, \dots)$$

• Vary D_c and β_D to mimic Soluble/Insoluble VEGF-A Parameters from literature.

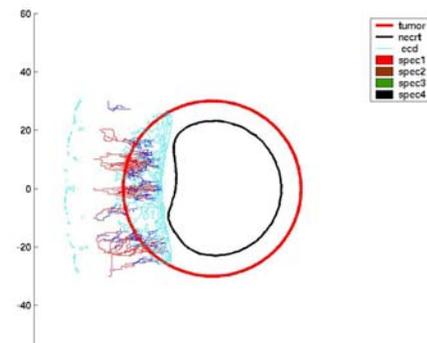

Day 0

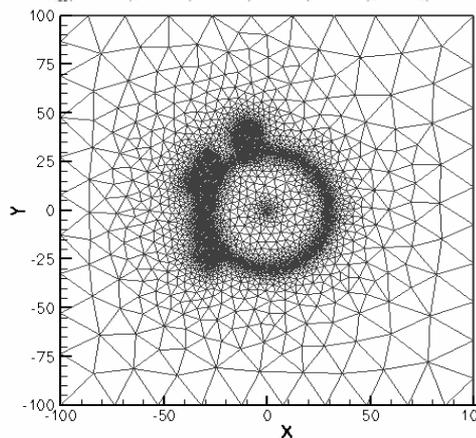

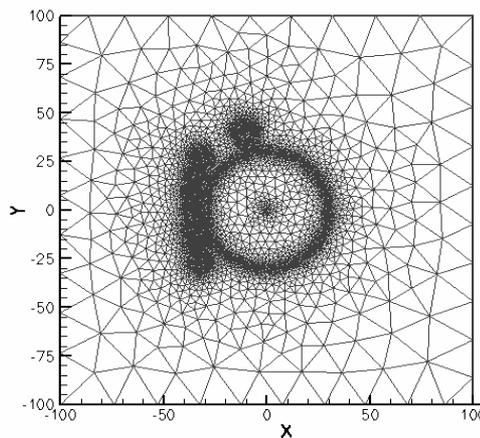

Day 10

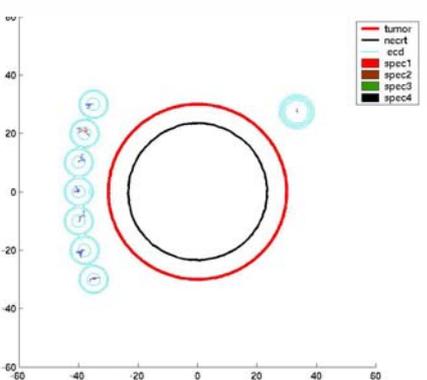

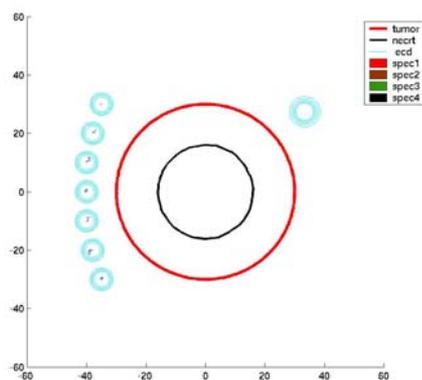

Day 20

Insoluble

Partly soluble

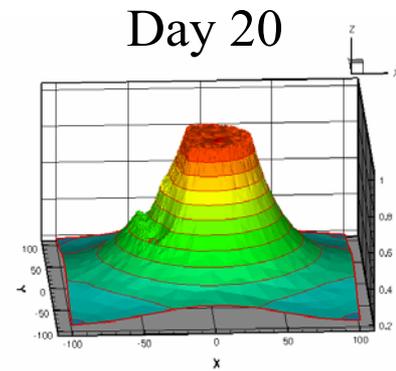

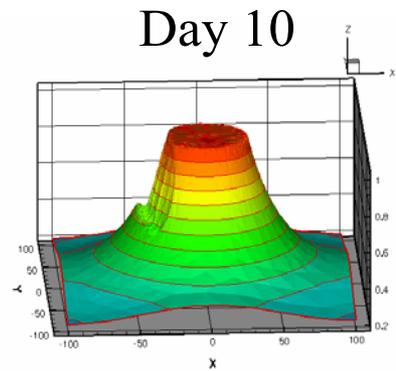

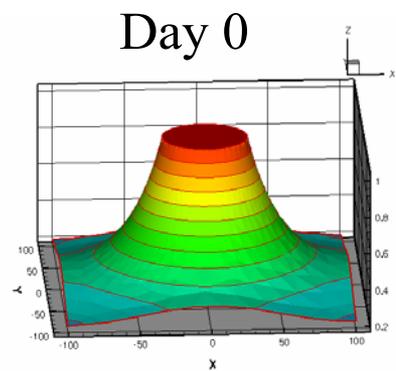

Soluble

• Chemotaxis/
Branching enhanced
with insoluble VEGF

• Qualitative agreement
with experiments

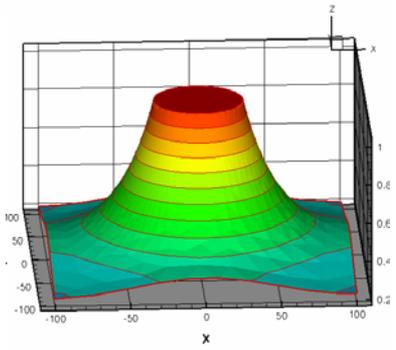

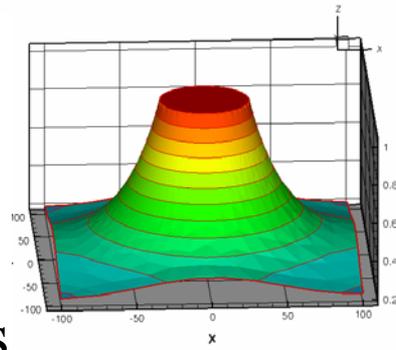

Mechanism

Distribution of VEGF:

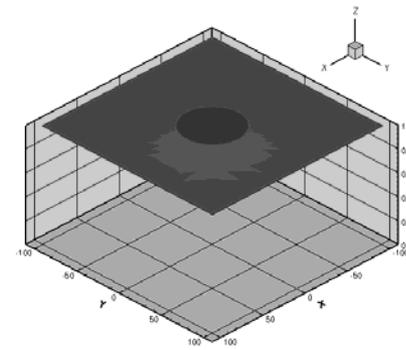

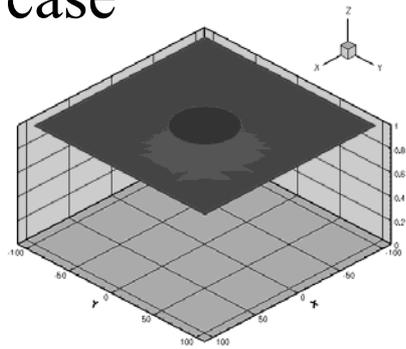

Insoluble

- Uptake of ECM-bound VEGF-A by EC produces large gradient in insoluble case

Partly soluble

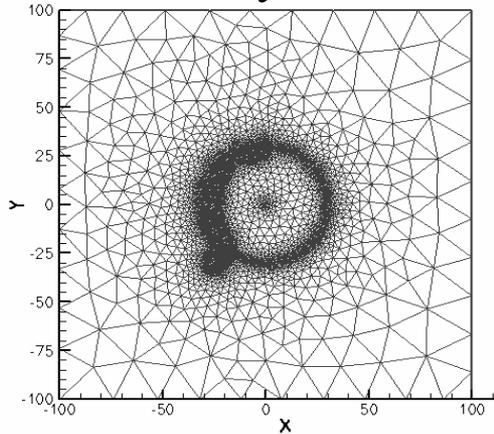

- Gradients enhance chemotaxis

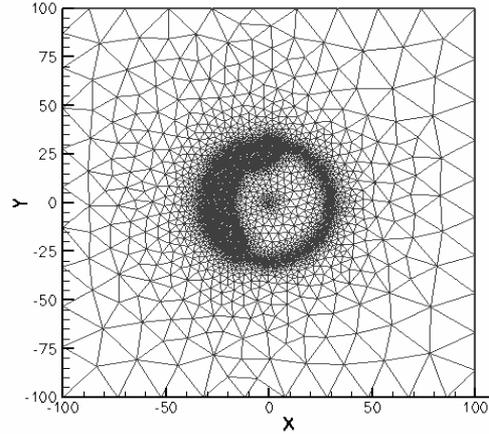

Soluble

Later times

Day 45

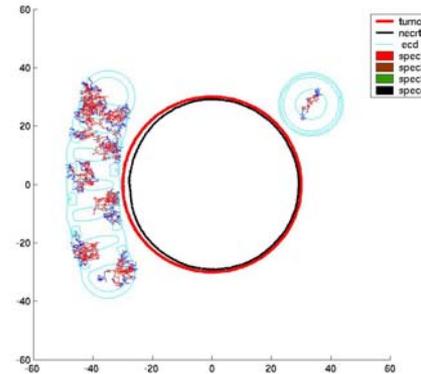

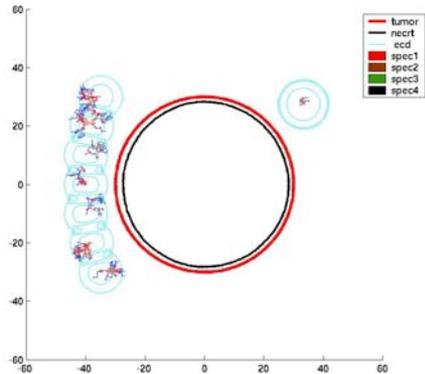

Day 70

Partly
Soluble

- Brush-border effect
- penetration

Soluble

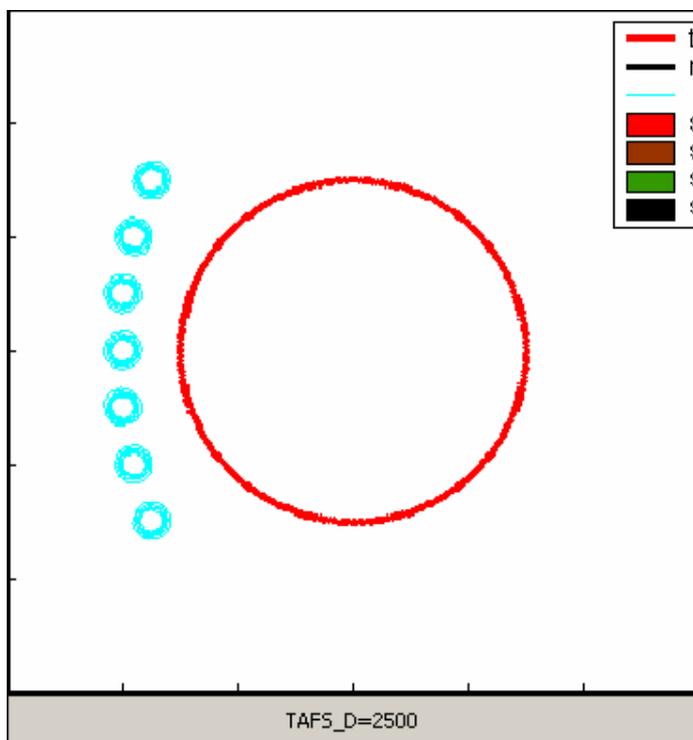

- Irregular vascular development
- No penetration

• Qualitative agreement with experiment

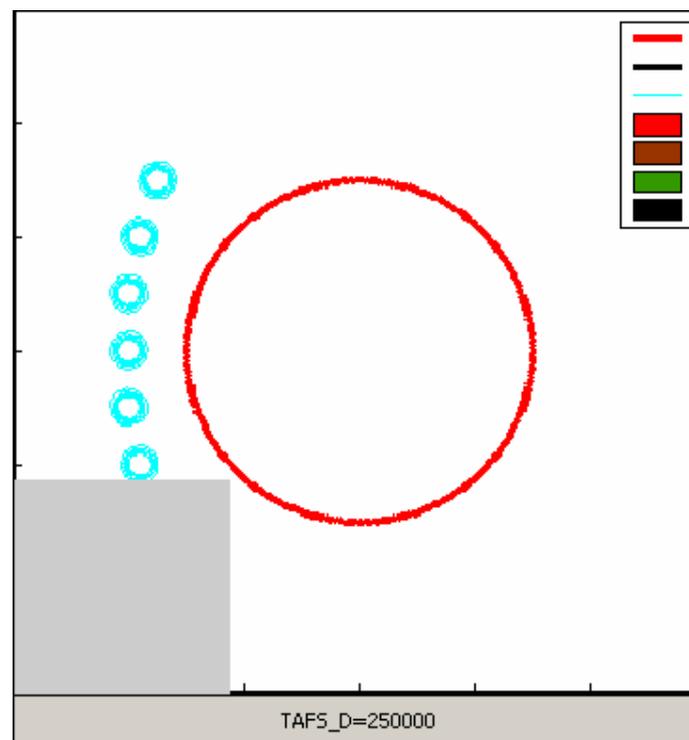

• Experimental results consistent with increased D_c and/or decreased β_c

Movies

Insoluble

Soluble

More sophisticated model

Insoluble

$$\frac{\partial C_I}{\partial t} = \nabla (D \nabla C_I) - \beta_D C_I - \beta_U C_I \frac{e}{e_0} - \beta_{cleave} \frac{e}{e_0} C_I$$

Cleaving

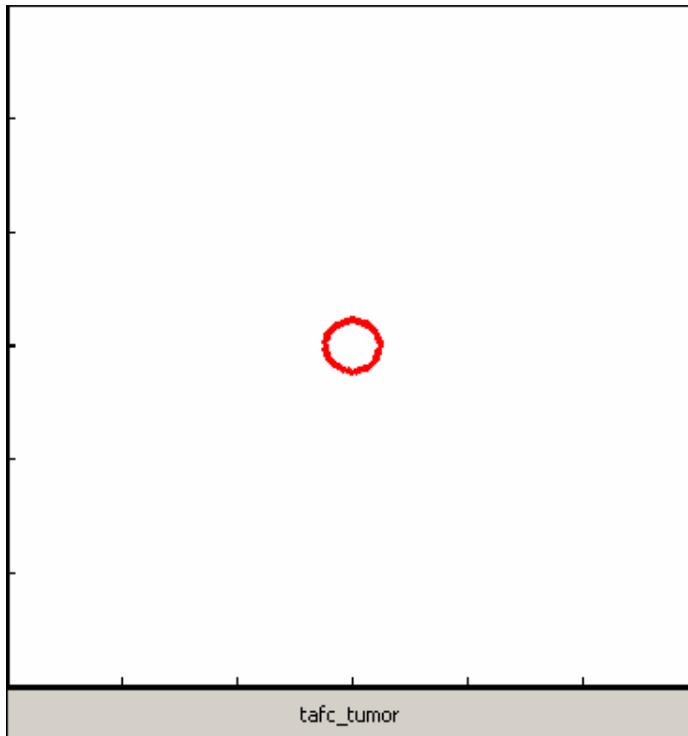

Soluble

$$0 = D_{sc} \nabla^2 C_S - \beta_{SD} C_S - \beta_{SU} C_S \frac{e}{e_0} + \beta_{cleave} \frac{e}{e_0} C_I$$

- Variable diffusion for insoluble TAF
- Test coupling with full tumor model
 - tumor and vessel development nonlinearly coupled

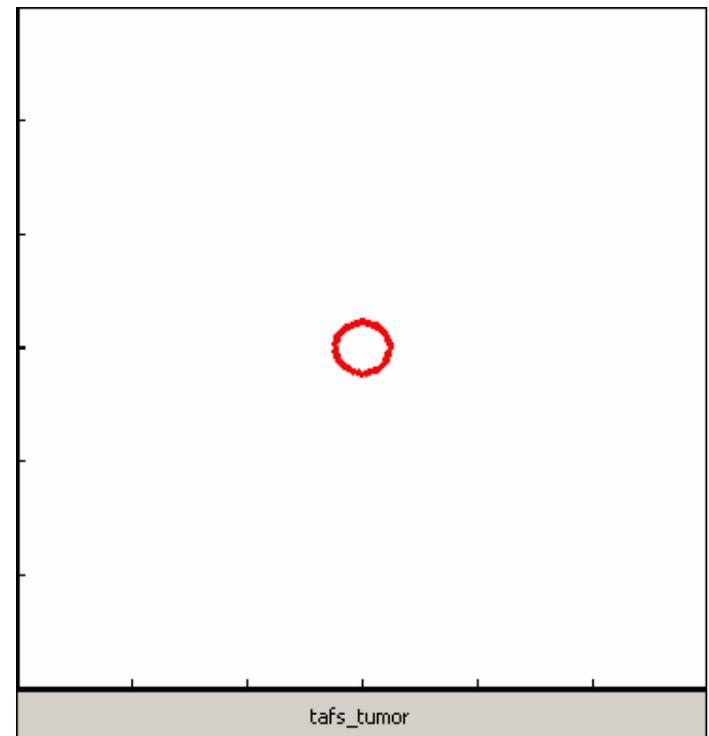

Fully coupled model

Insoluble

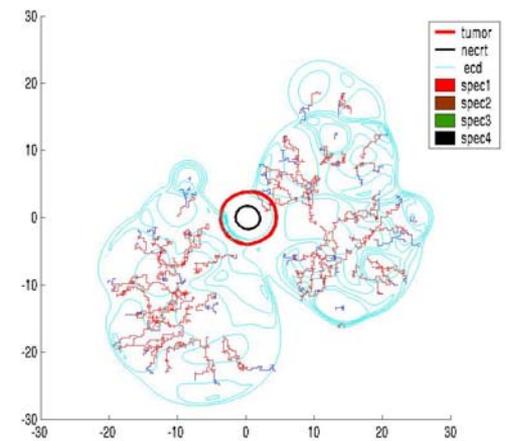

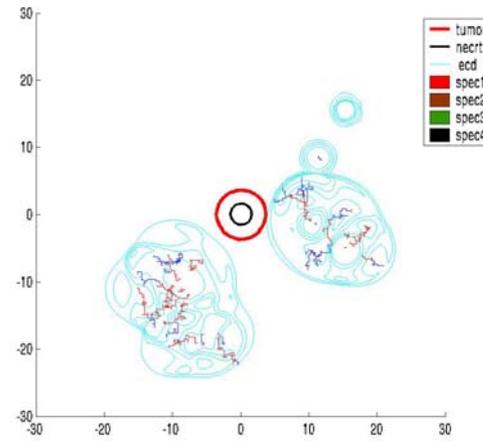

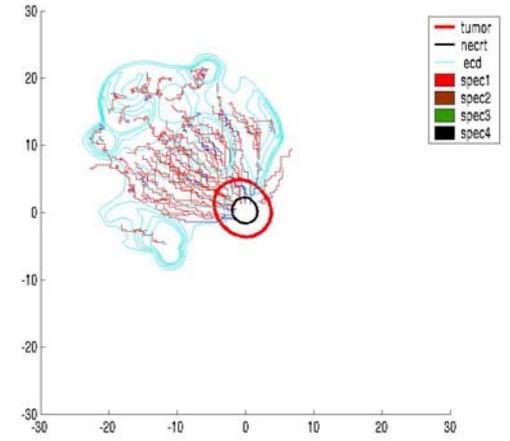

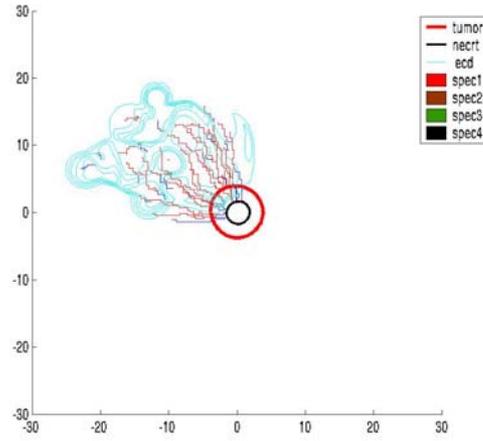

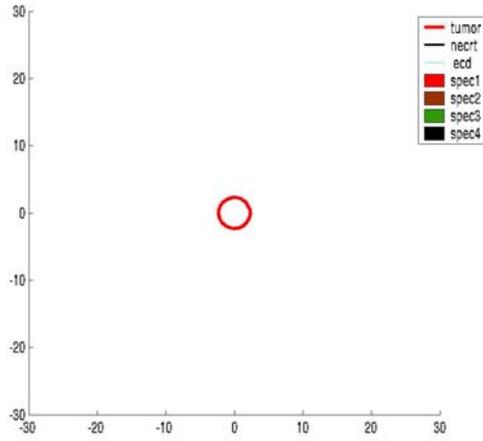

- Brush-border effect
- Penetration
- Growth of tumor

Soluble

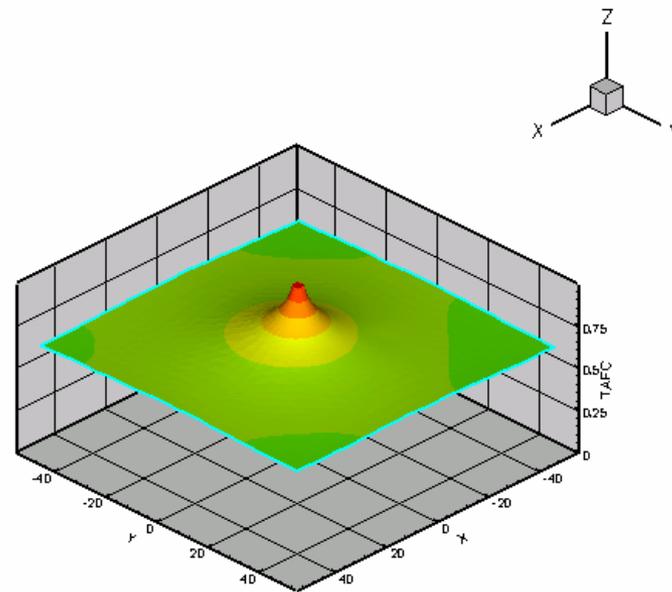

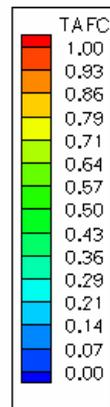

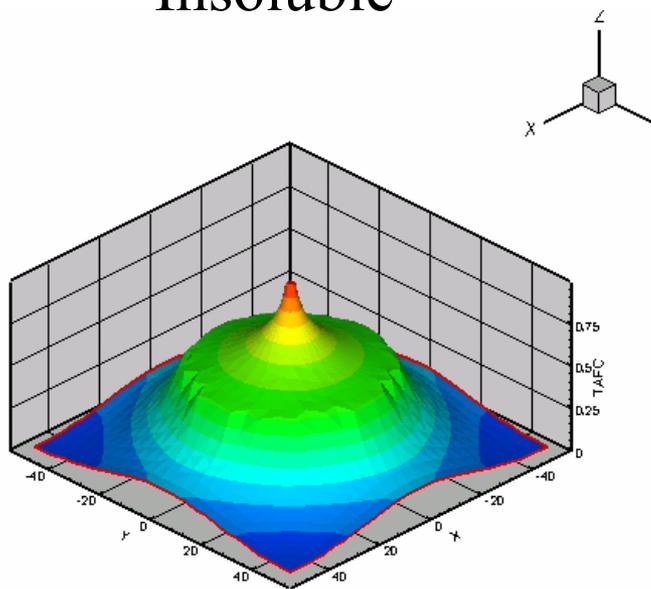

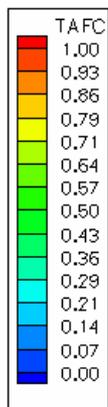

- Irregular vascular development
- little penetration
- Less growth

Stills

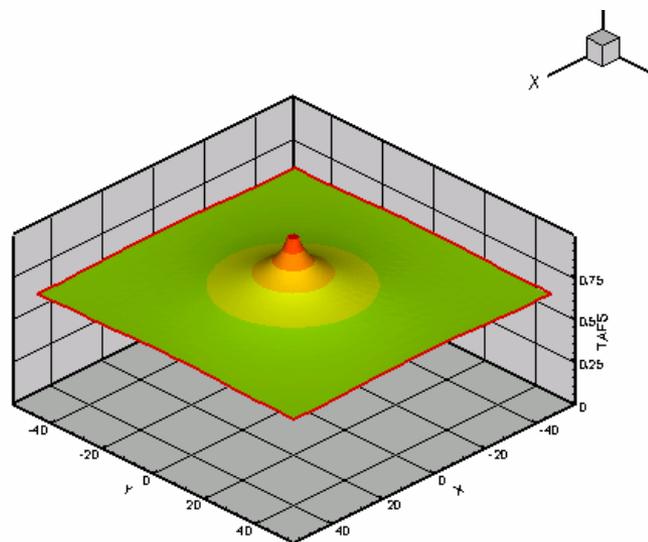

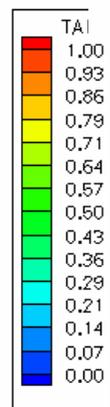

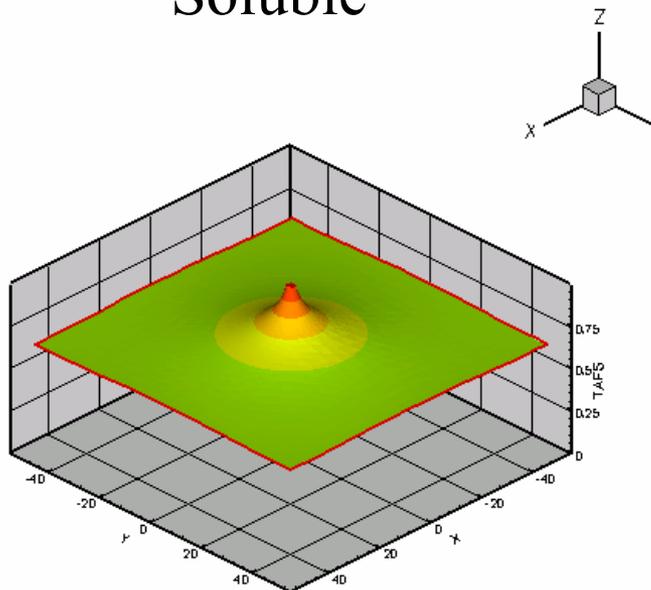

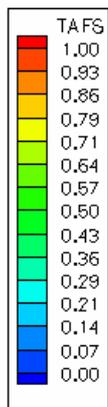

VEGF

Insoluble

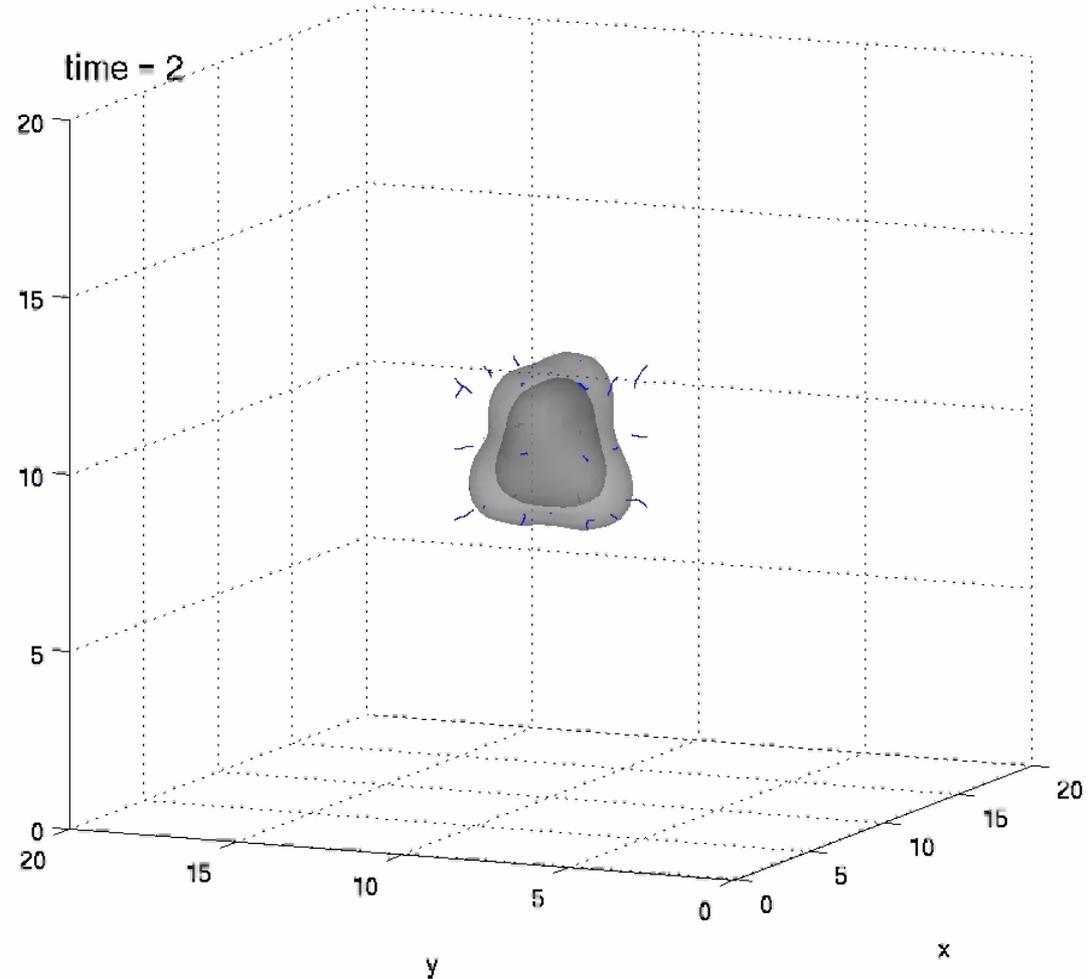

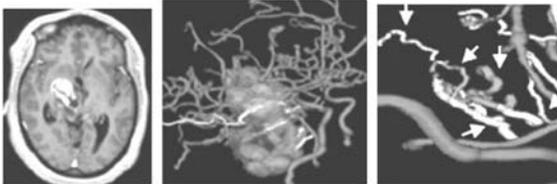

Soluble

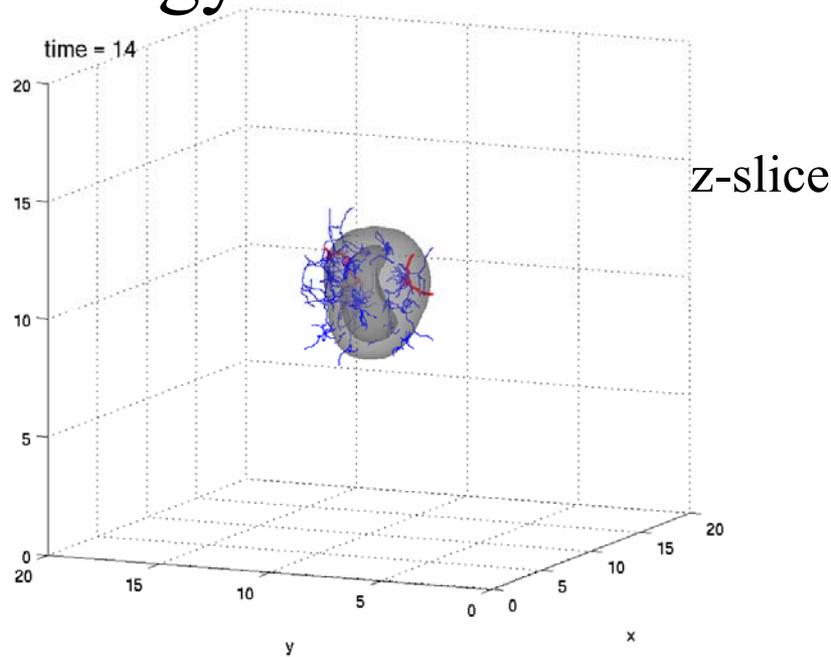

Vascular cooption

- Initial capillaries present
- Growing tumor surrounds vessels
- Uses up available vasculature
- Secondary angiogenesis
- Observe bursts of growth as the nutrient supply increases (like a fire)

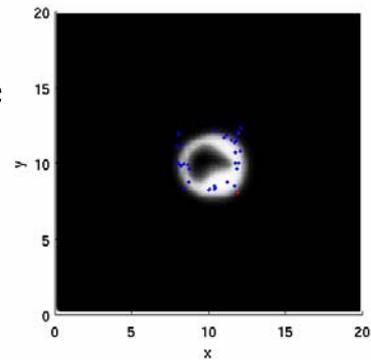

Bullitt et al (2005). Glioma

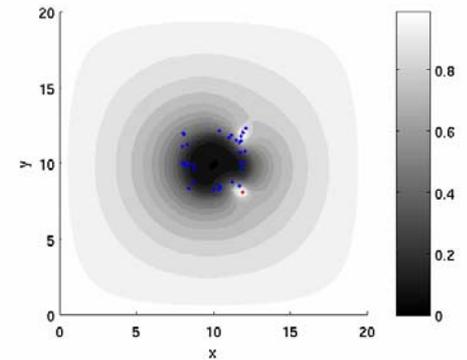

Histology Slices

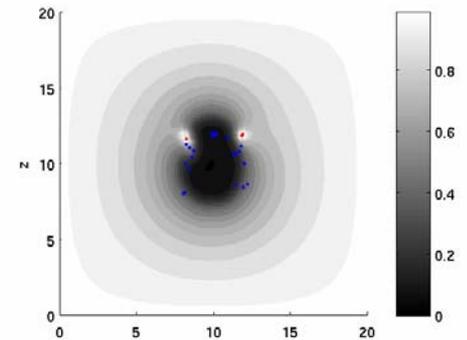

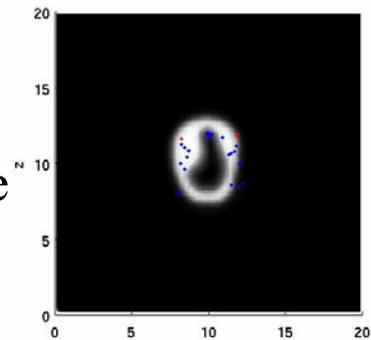

Viable cells

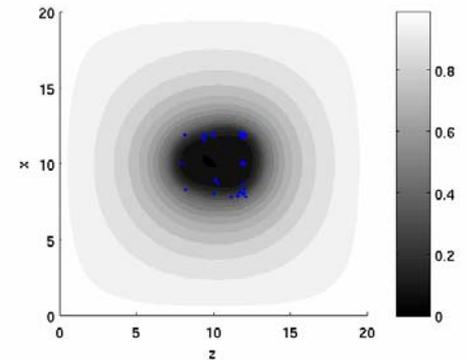

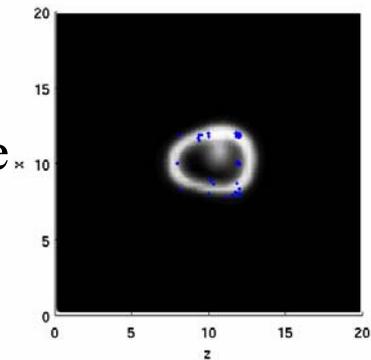

Nutrient

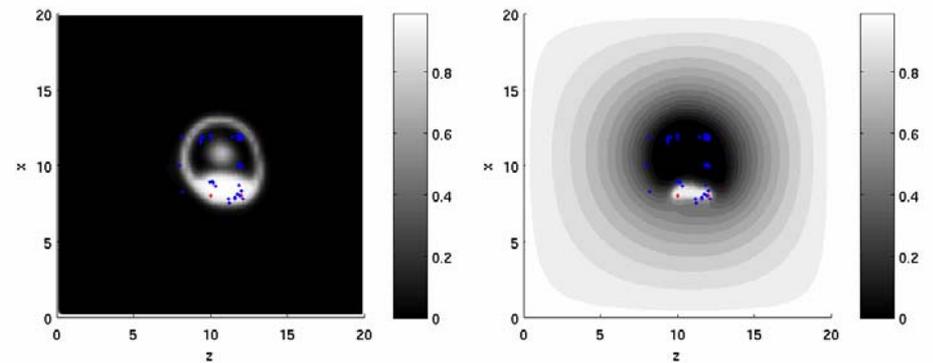

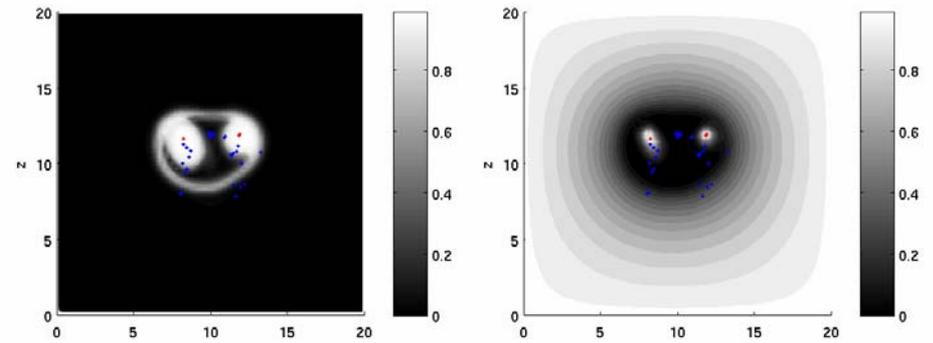

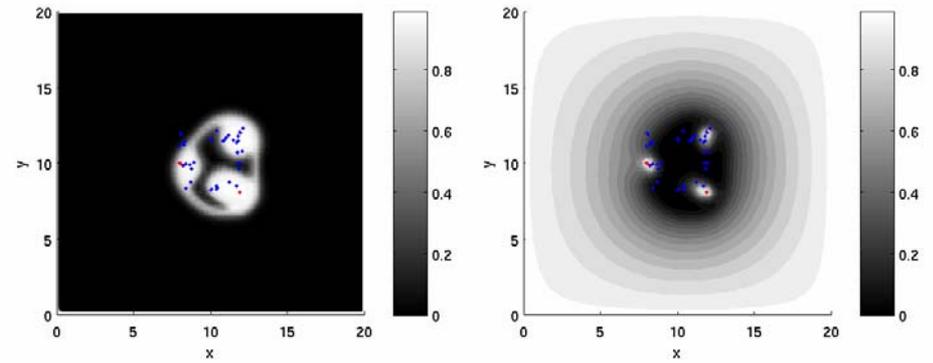

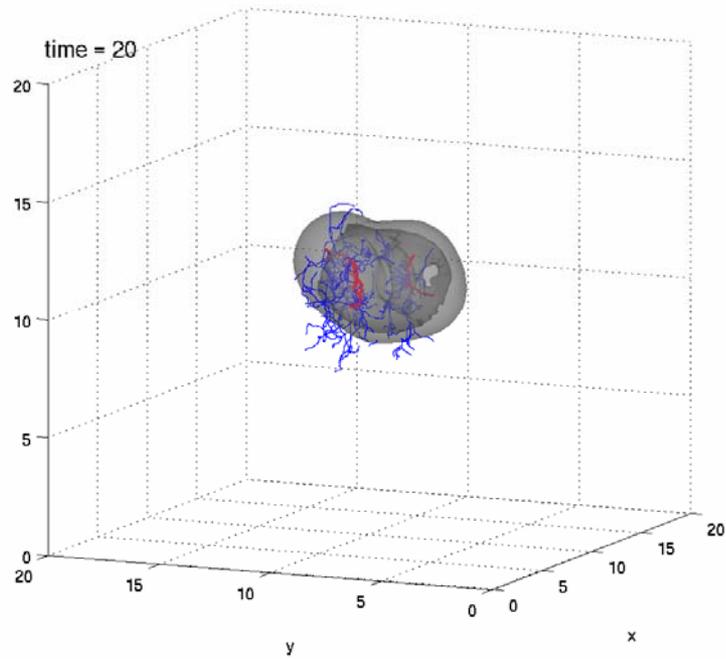

x-slice

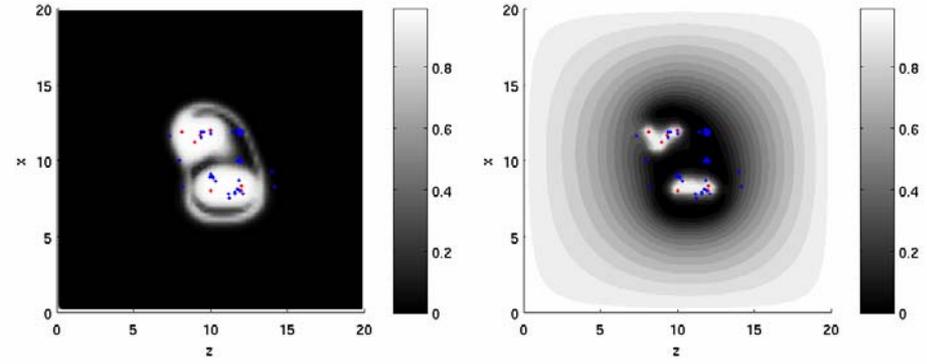

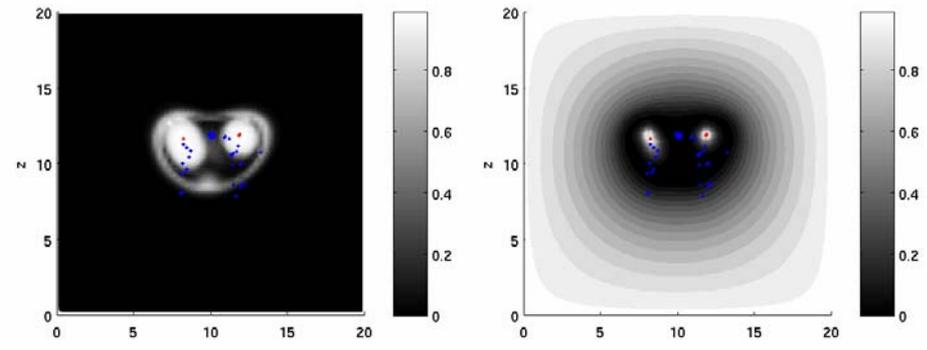

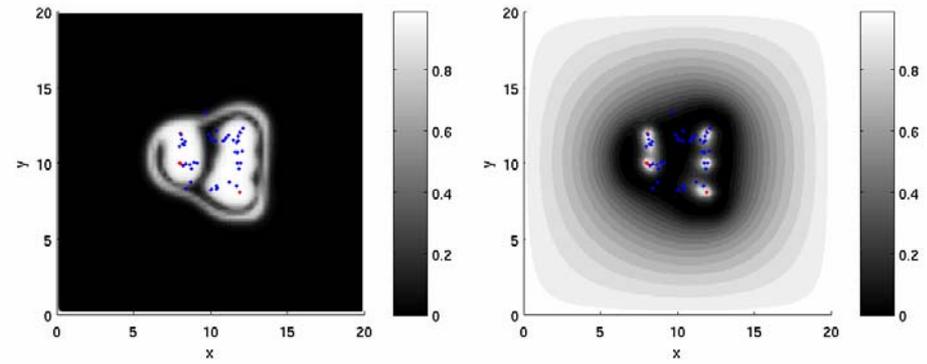

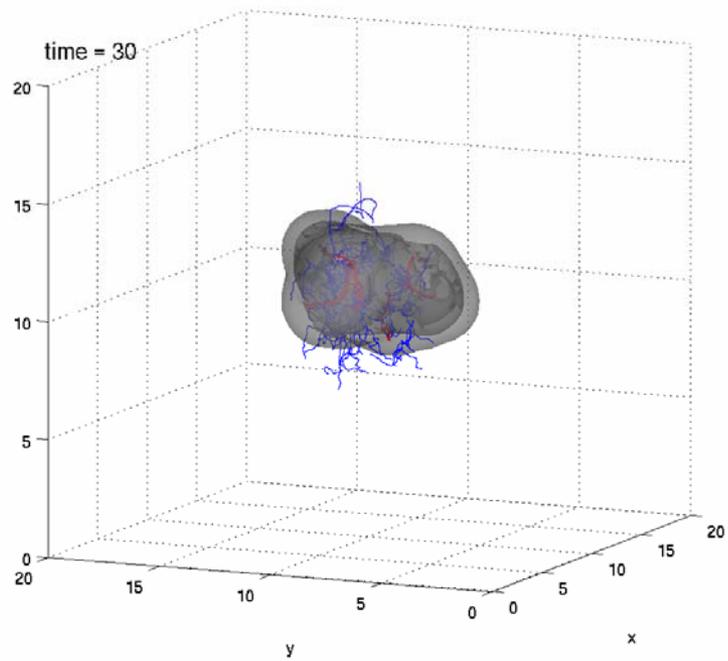

y-slice

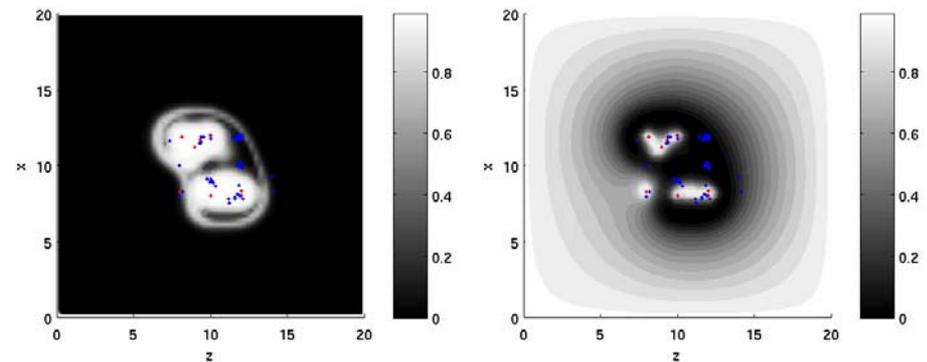

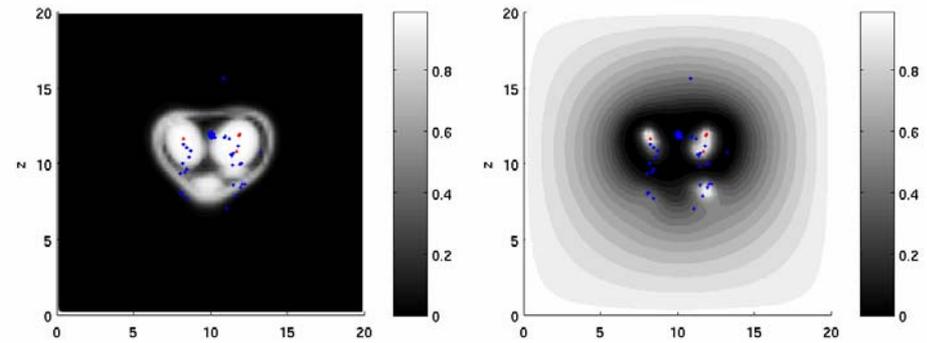

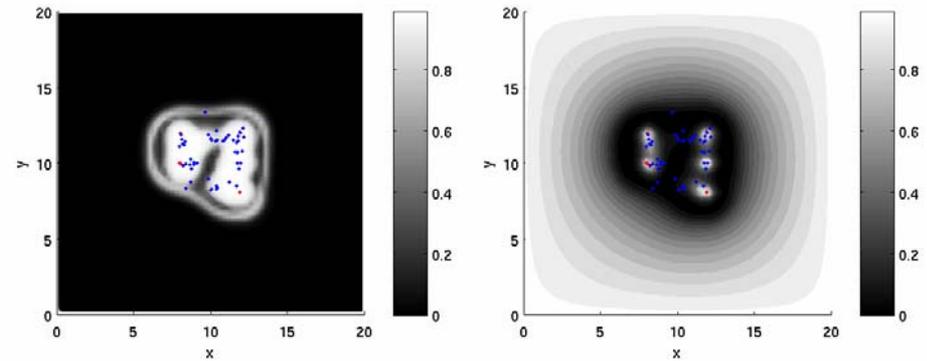

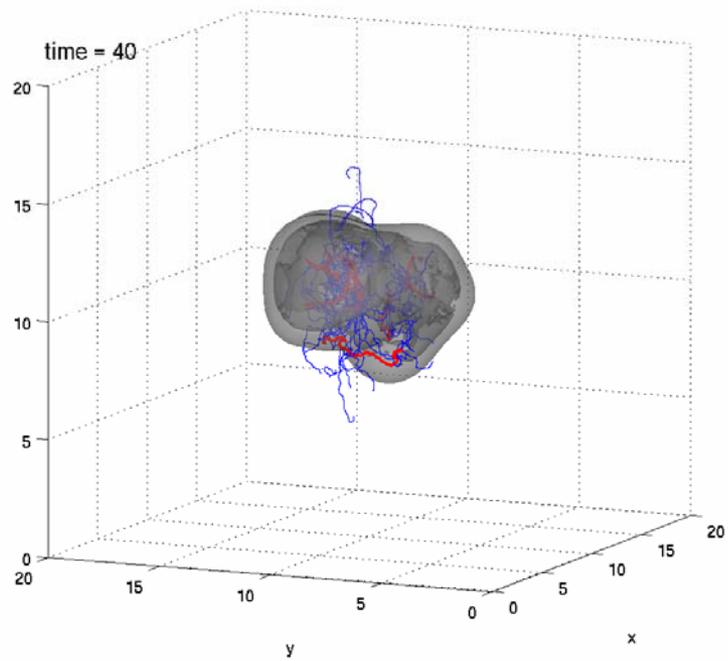

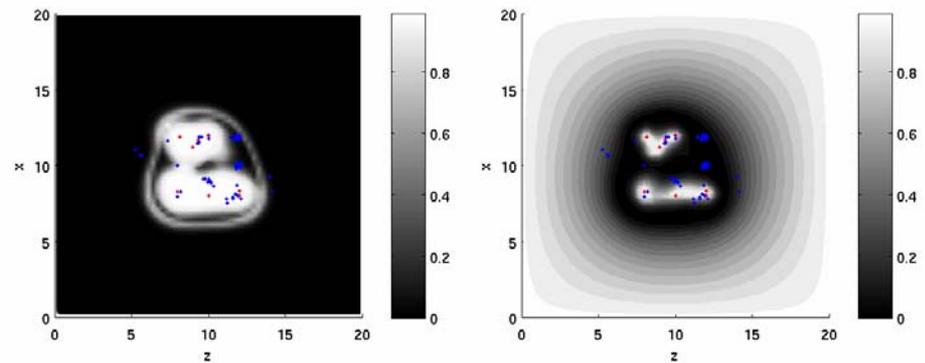

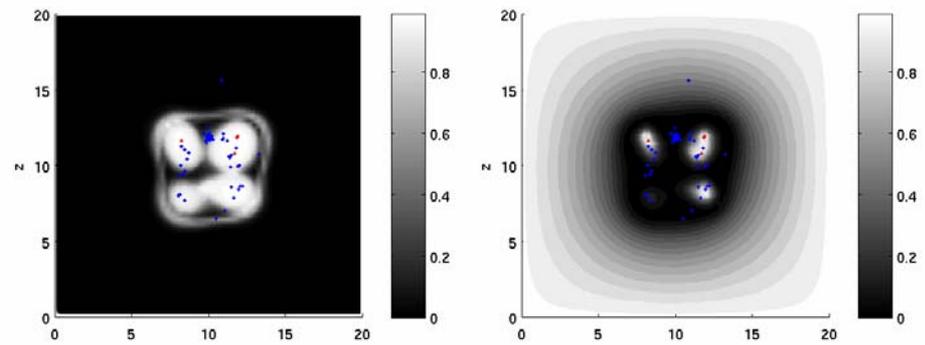

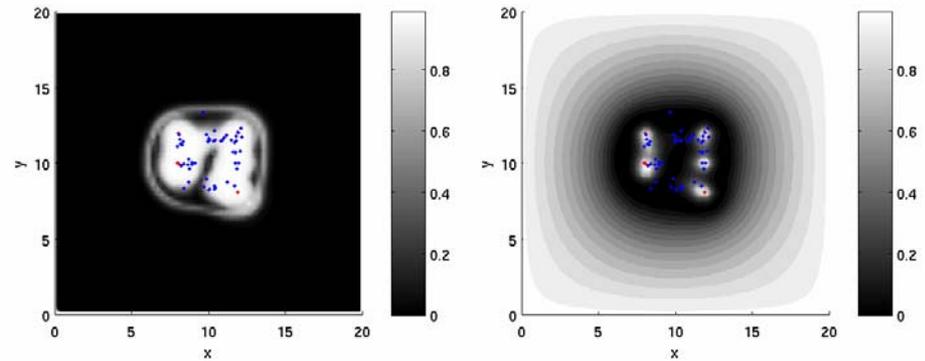

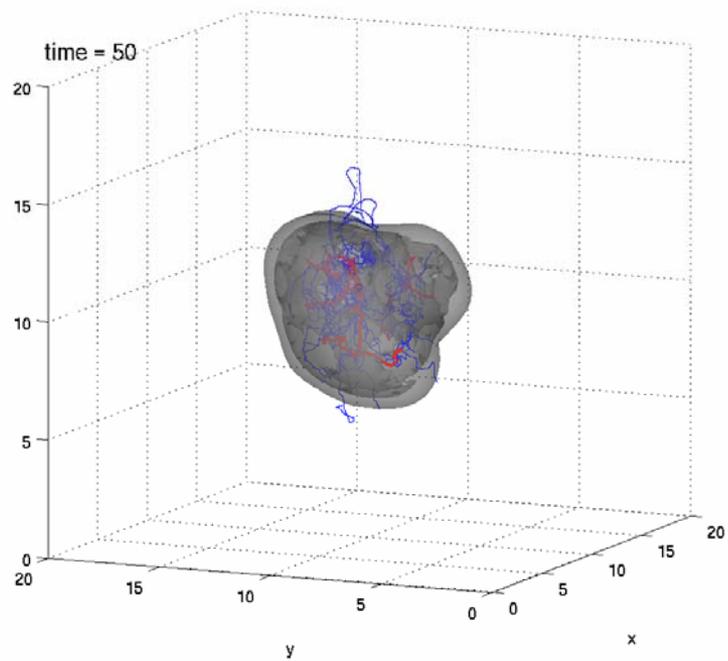

- Note nutrient supply localized near red (nutrient-releasing) vessels
- Observe corresponding (tumor) near vessels cell growth

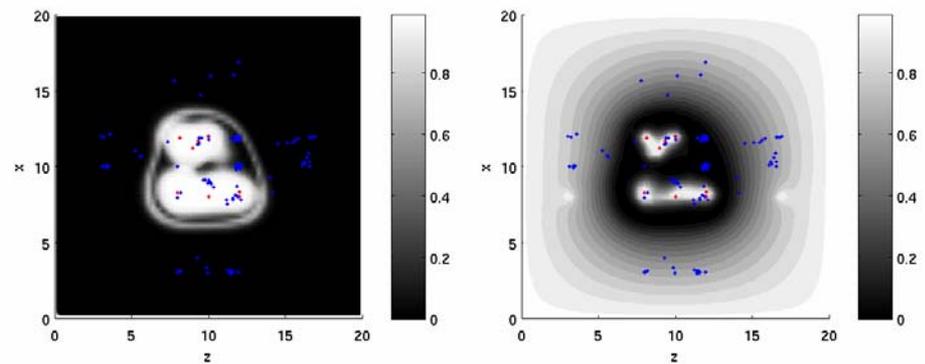

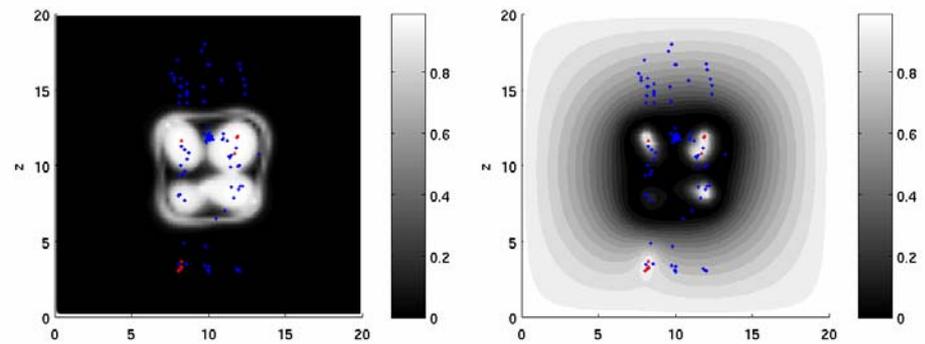

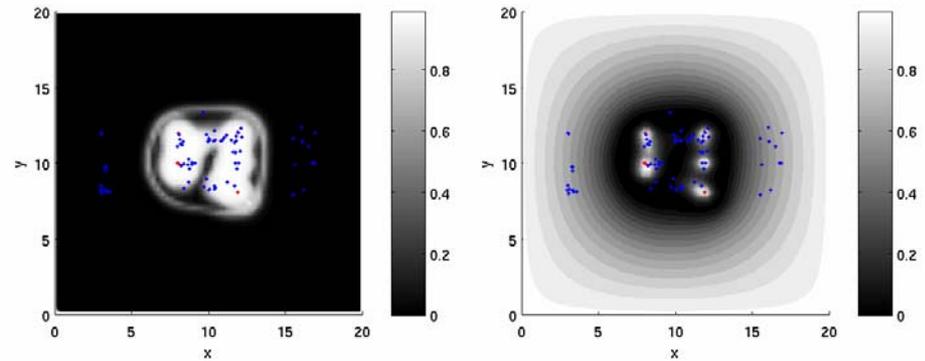

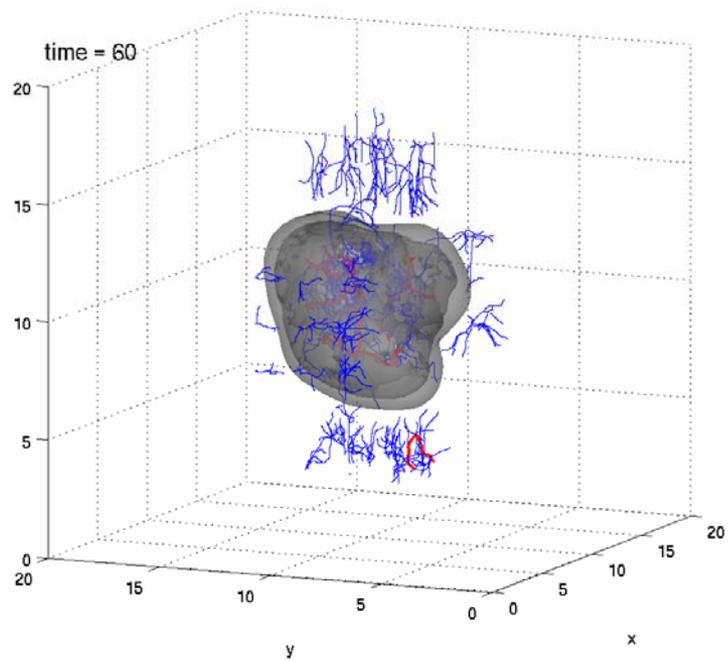

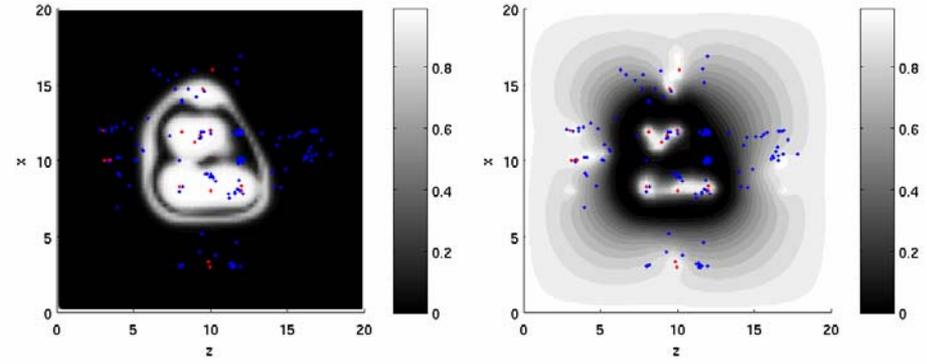

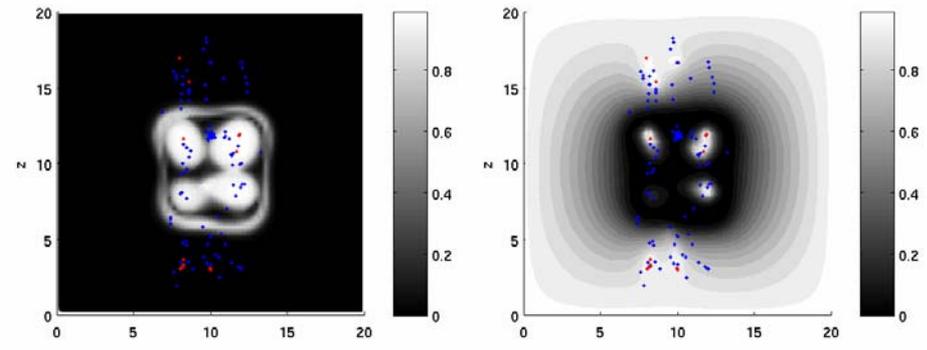

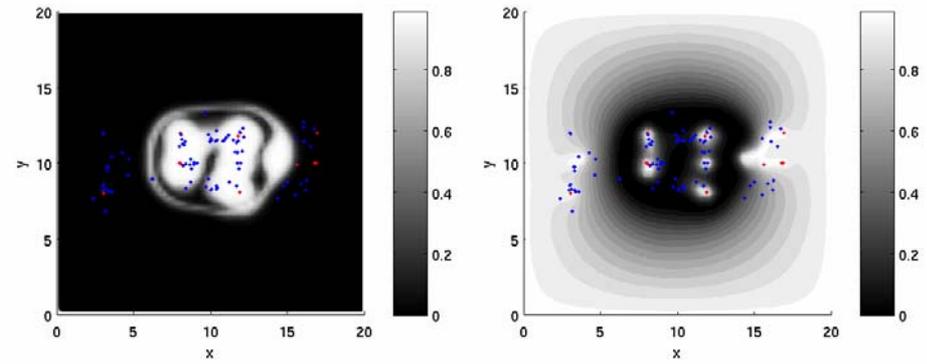

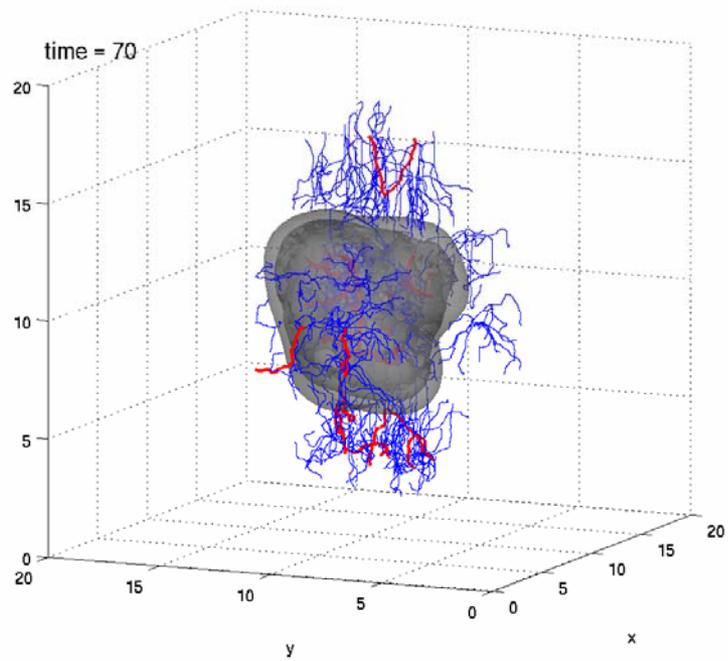

•Regions of hypoxia separate cell clusters

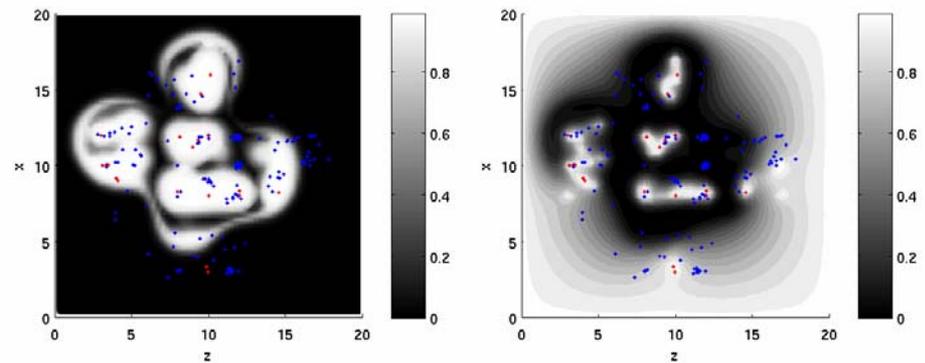

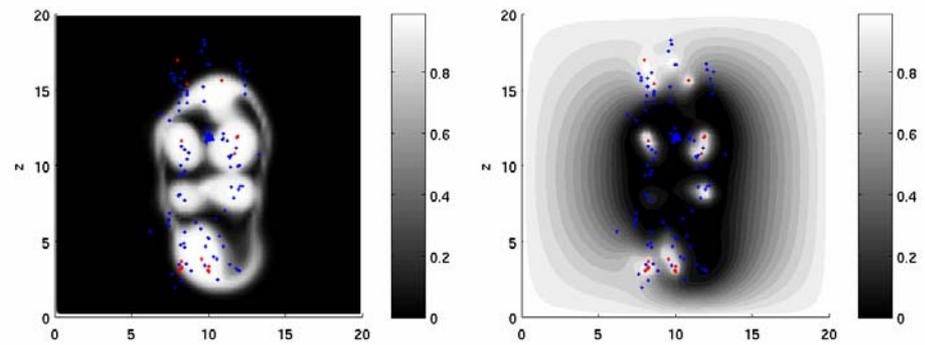

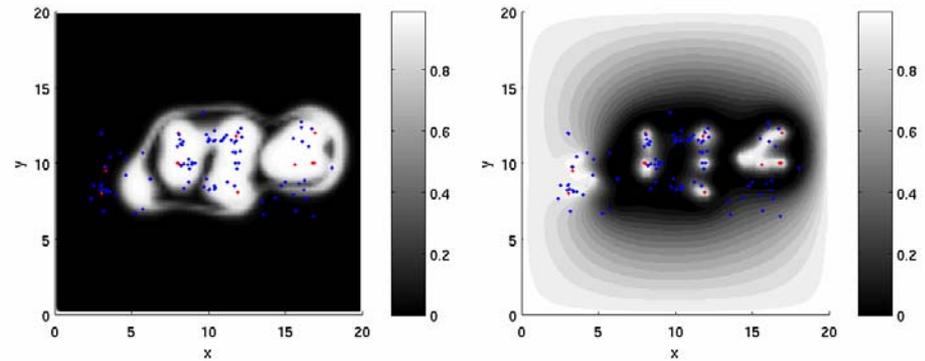

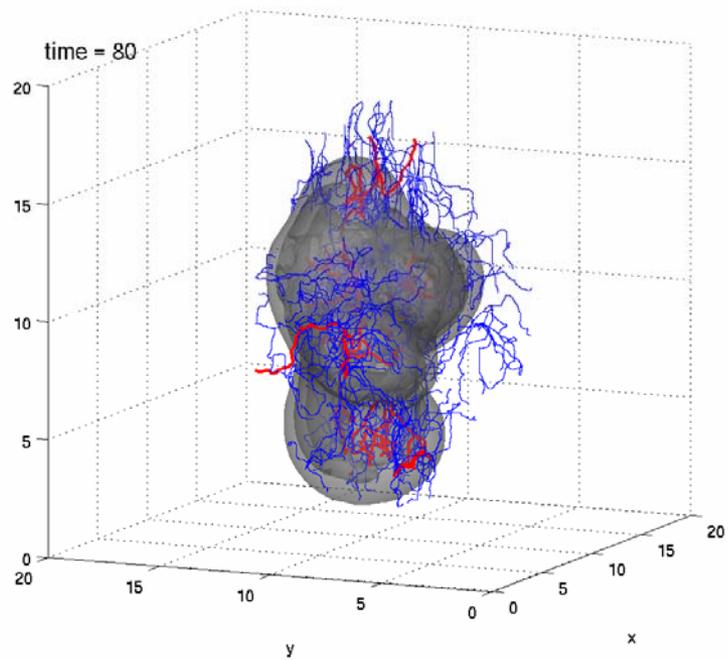

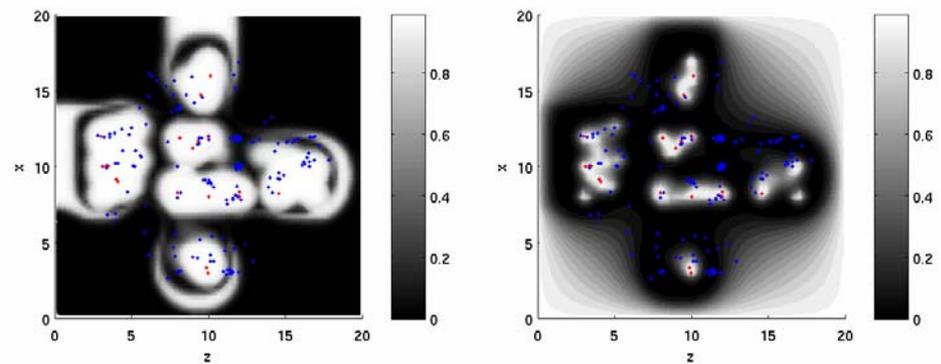

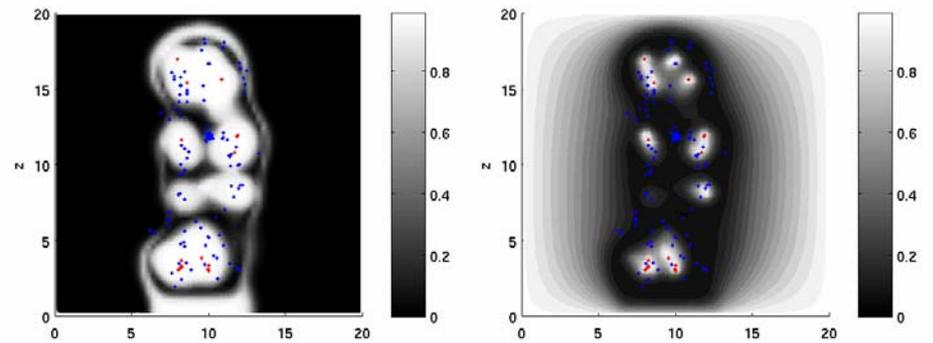

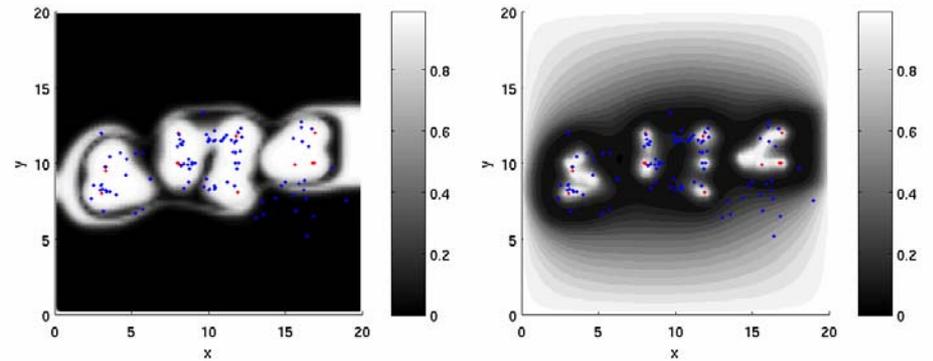

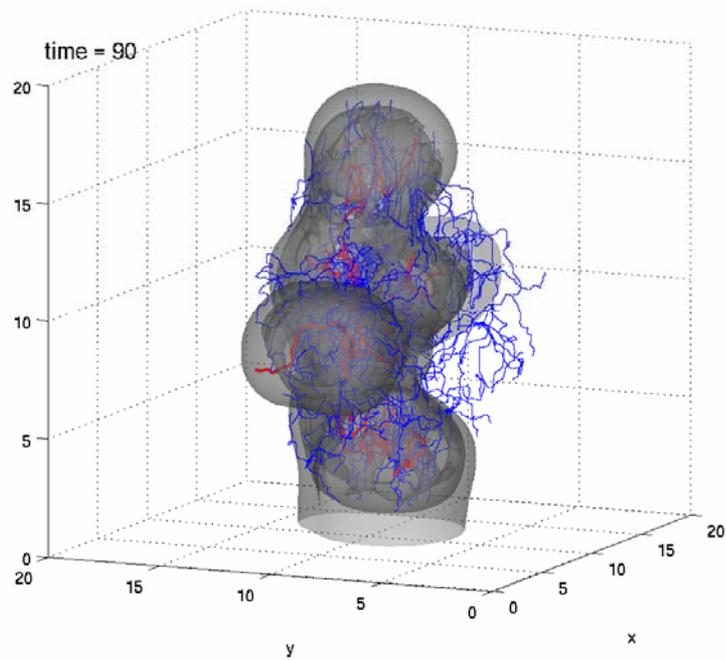

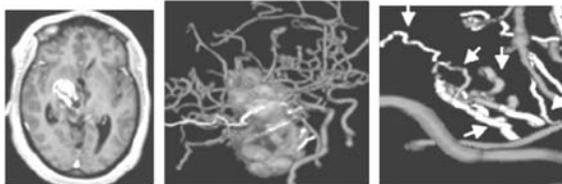

Bullitt et al (2005). Glioma

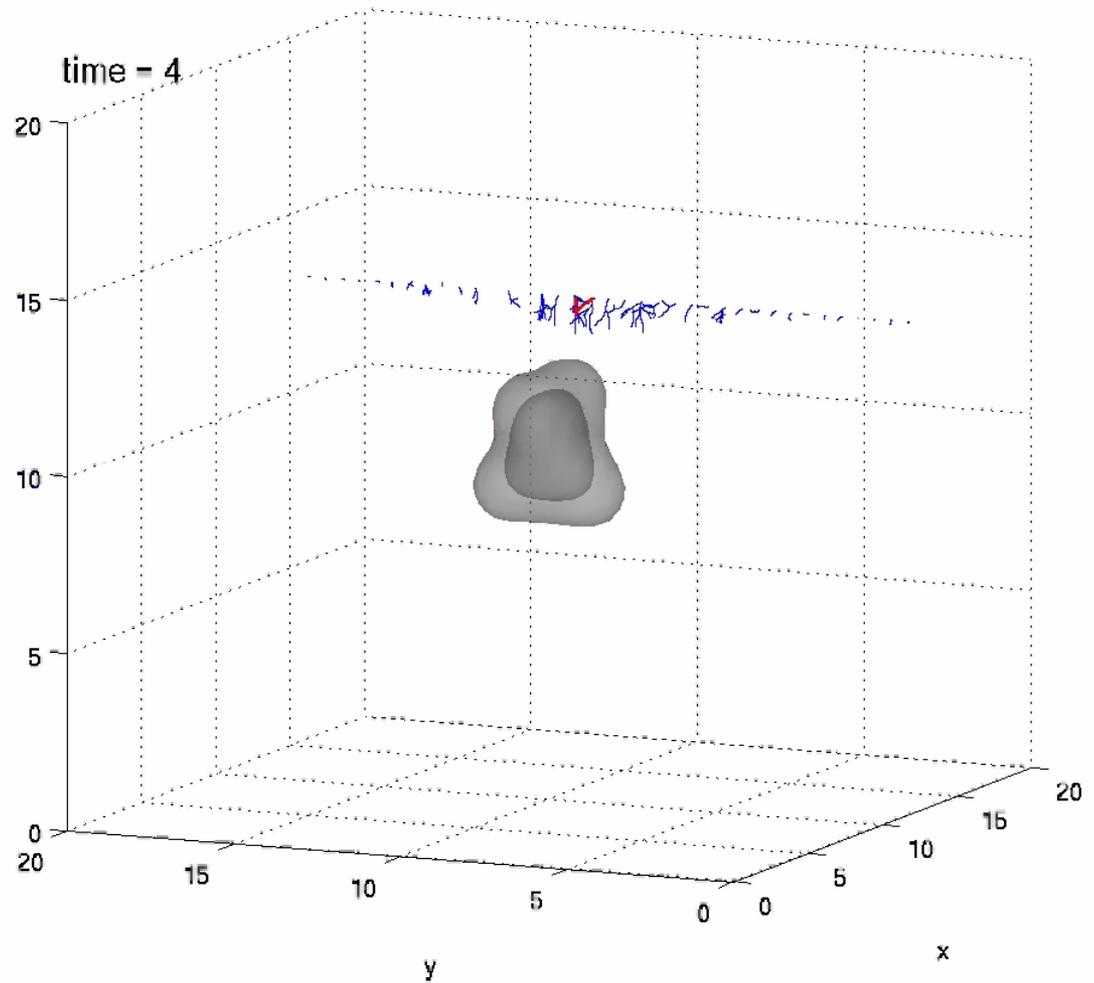

c.

d.

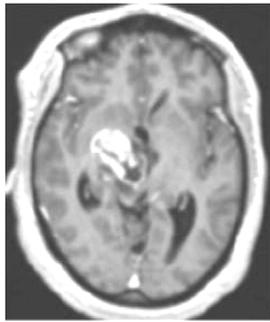

e.

Vascular co-option

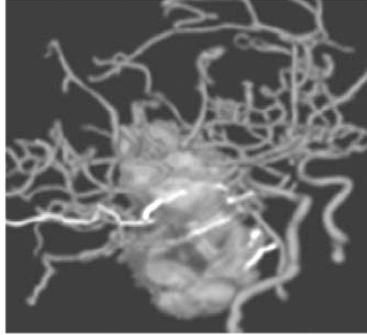

- Initial capillary present
- Growing tumor surrounds vessels
- Continuous angiogenesis.

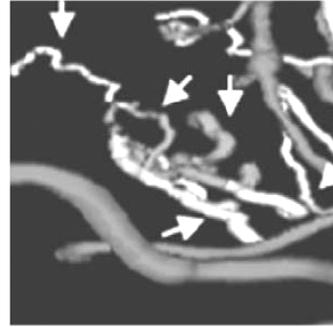

Bullitt et al (2005). Glioma

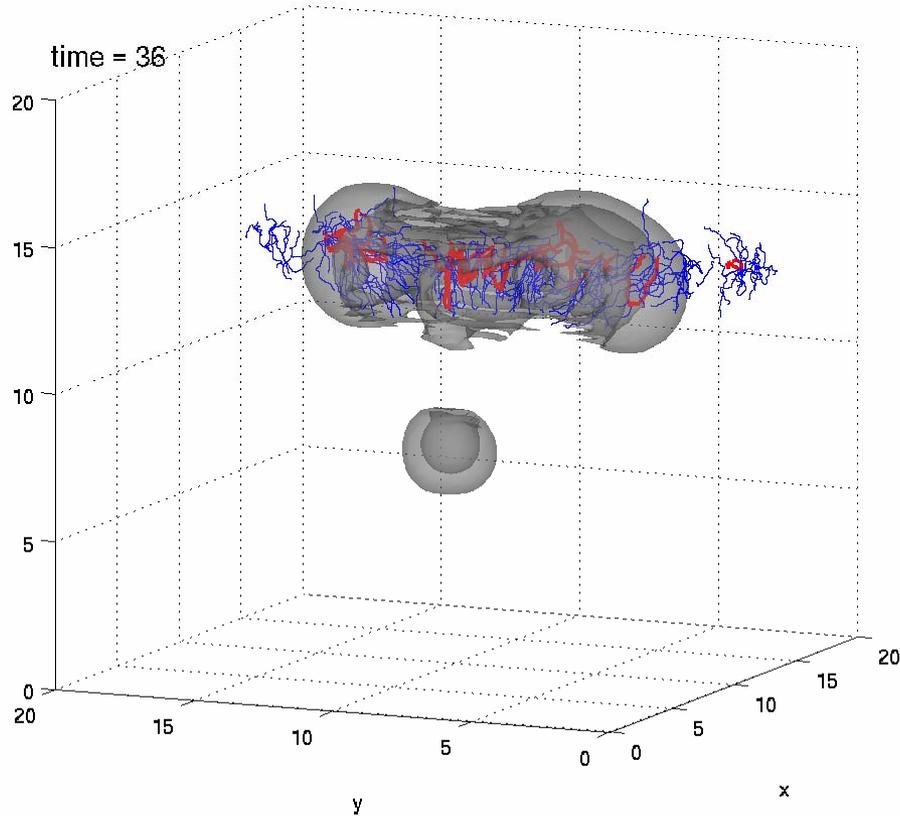

c.

d.

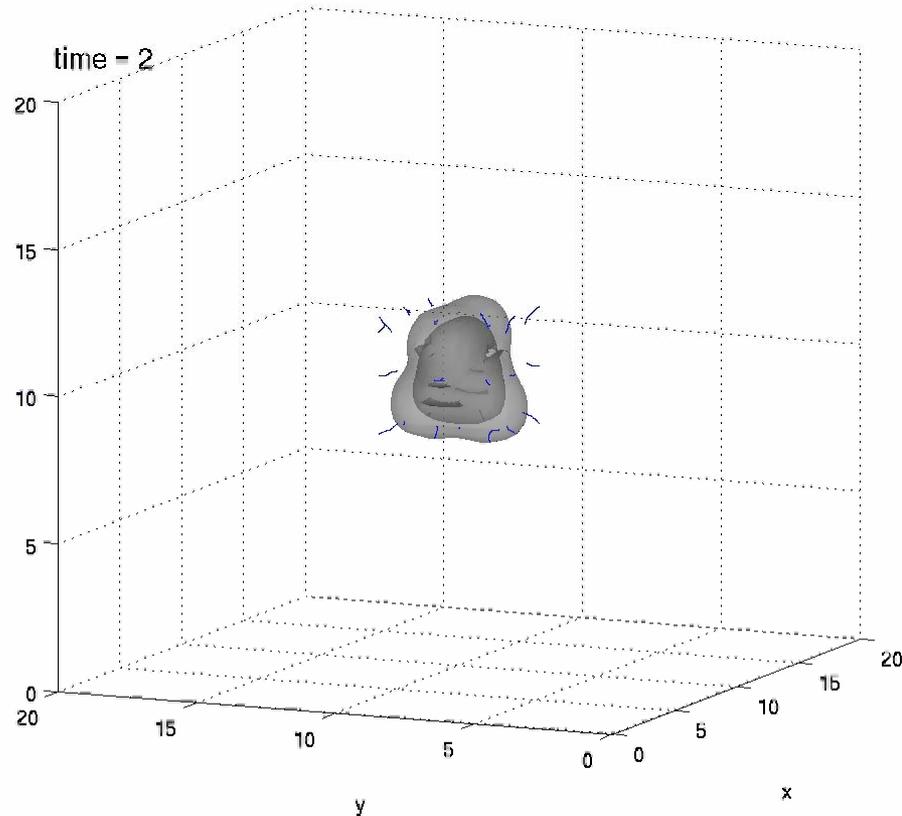

e.

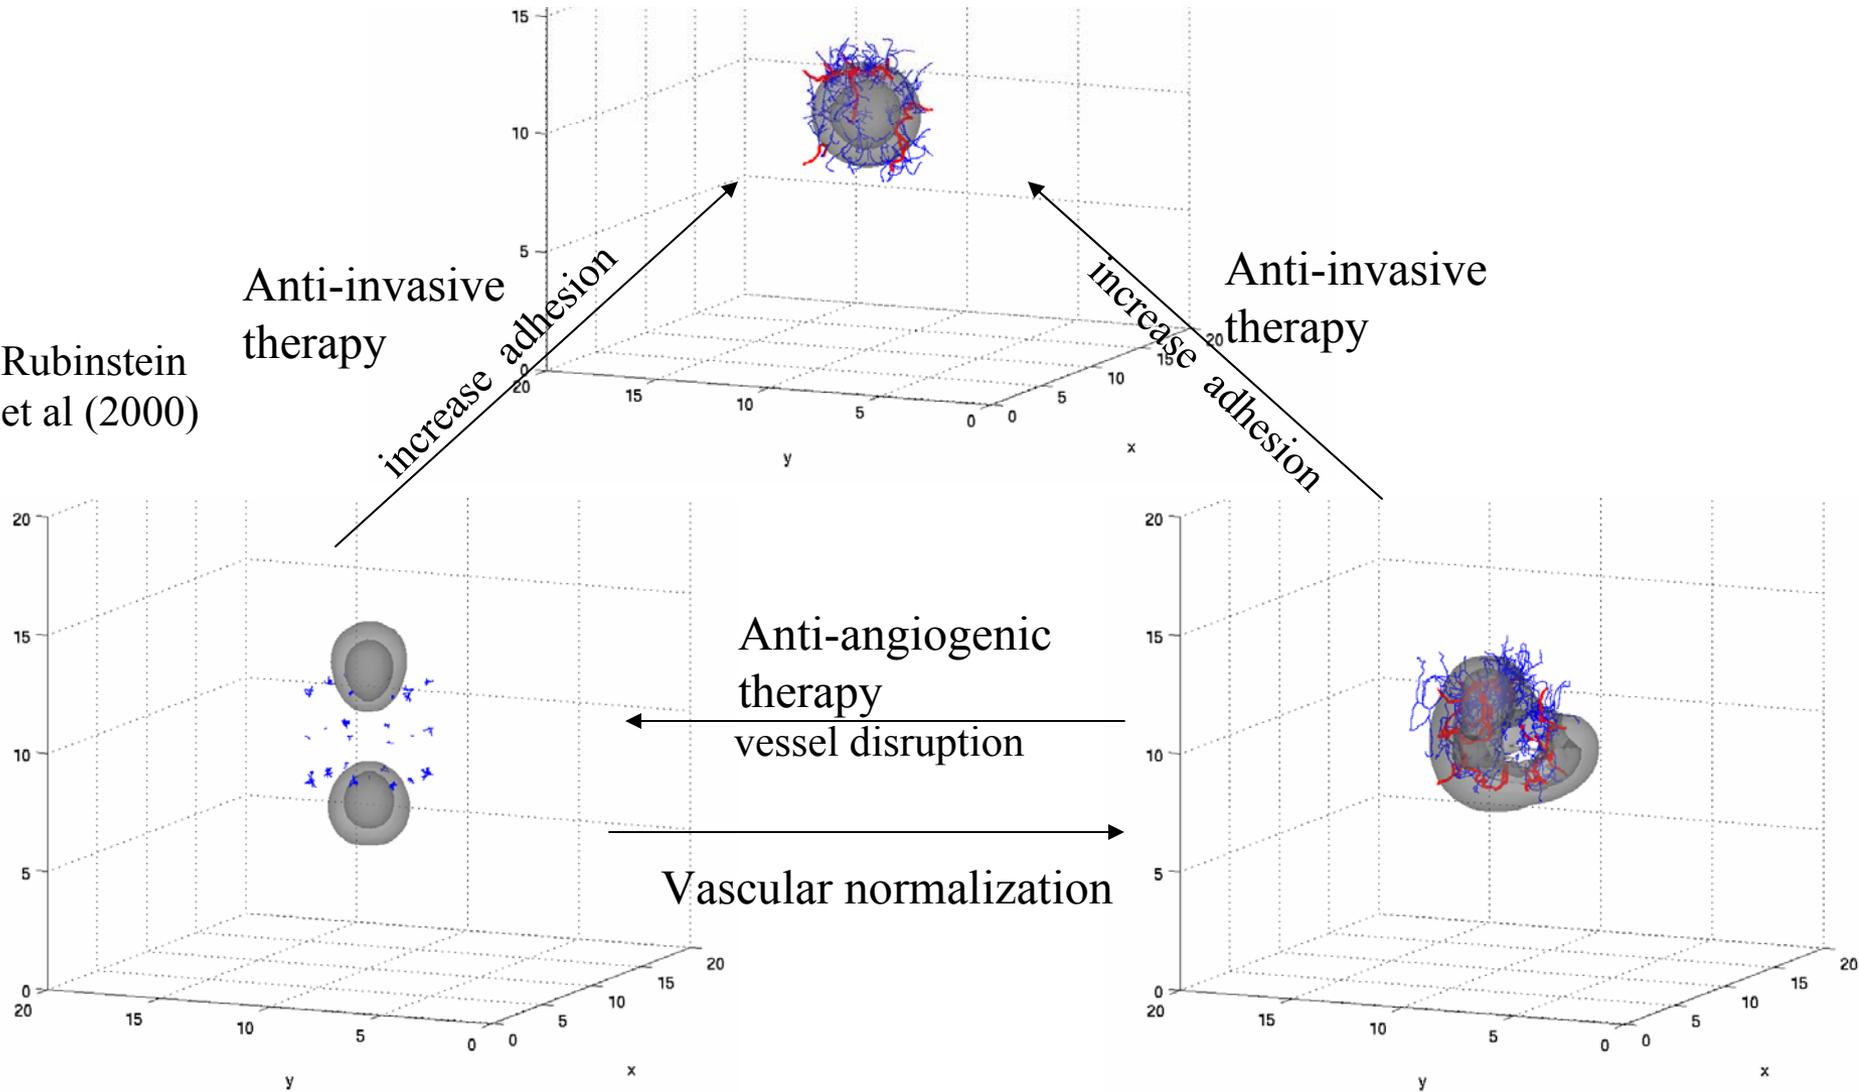

Effect of vessel aging

- As vessels age, the perfusion is reduced.
- Typically angiogenesis occurs very close to the tumor
- Observe bursts of growth as the nutrient supply increases and decreases (like a fire)

Implications for therapy

Rubinstein
et al (2000)

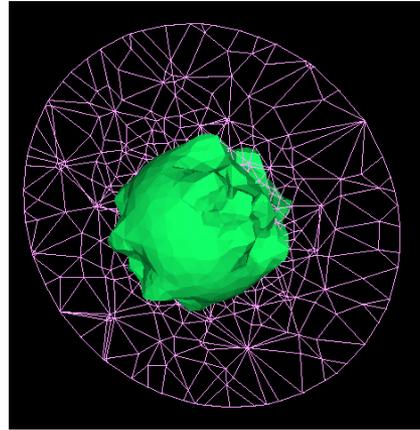

2D: Cristini, et al., Cancer Res. (2006)

Conclusions

- Developed a framework to model tumors through all phases of growth
- Nonlinear coupling of neovascular development and tissue/tumor growth
- Qualitative agreement with experiments by Iruela-Arispe for neovascular morphology
 - morphology controlled by diffusion/degradation of VEGF-A
- Needs further work: MMPs, identification of biophysical mechanisms
- Vascular remodeling/flow, etc.

Ongoing and Future work

- 3D

- Direct modeling of VEGF-A/ECM/MMP interaction on Neovascular morphology.
- Realistic mechanical/diffusional description of tissue
- Cell-signaling– macro/micro nonlinear coupling
