

# MATH 147 Review: Surjectivity and Injectivity

## Facts to Know

<p>Surjective</p> <p><math>f: X \rightarrow Y</math></p>	<ul style="list-style-type: none"> <li>For each <math>y \in Y</math>, there exists <math>x \in X</math> such that <math>f(x) = y</math></li> <li><math>\text{ran}(f) = Y</math></li> </ul>	
<p>Injective</p> <p><math>f: X \rightarrow Y</math></p>	<ul style="list-style-type: none"> <li>For all <math>x_1, x_2 \in X</math>, if <math>f(x_1) = f(x_2)</math> then <math>x_1 = x_2</math></li> </ul>	
<p>Bijjective</p> <p><math>\equiv</math> surjective and injective</p>	<ul style="list-style-type: none"> <li>No point in the range is mapped to more than once.</li> </ul>	

## Examples

- Consider two sets  $X = \{1, 2, 3, 4\}$  and  $Y = \{-8, 0, 20\}$ . Let  $f$  be a surjective function from  $X$  to  $Y$  such that for any two elements  $x_1$  and  $x_2$  of  $X$ , if  $x_1 < x_2$ , then  $f(x_1) \leq f(x_2)$ . What is the minimum possible value of  $f(4)$ ?

$$f(4) = 20$$

2. A function  $f$  maps the elements of  $A = \{14, 16, 18, 20\}$  to elements of  $B = \{55, 66, 77, 88, 99\}$ .  
How many of the possible maps  $f$  are not injective?

$$5^4 = \# \text{ functions}$$

$$\# \text{ not injective} = \underbrace{\# \text{ functions}}_{5^4} - \# \text{ injective} = 120 = \text{final answer}$$
